1 Documentation overview for hyperref

The documentation for package `hyperref` consists of several files:

Manual The user documentation is also available as HTML.

README Here information is collected that is not yet in the manual: new features, package compatibility, limitations, known problems, ...

ChangeLog This file records the version history.

Options This file provides a short option summary.

Bookmark talk, slides Slides for the talk “PDF information and navigation elements with hyperref, pdfTeX and thumbpdf” at EuroTeX 1999.

Bookmark talk, paper The paper version of the talk.

Source code documentation:

hyperref.dtx This is the source code documentation for hyperref (this file).

backref.dtx “Back referencing from bibliographical citations”

nameref.dtx “Section name references in L^AT_EX”

3 File hycheck.tex

Many commands of L^AT_EX or other packages cannot be overloaded, but have to be redefined by hyperref directly. If these commands change in newer versions, these changes are not noticed by hyperref. With this test file this situation can be checked. It defines the command \checkcommand that is more powerful than L^AT_EX's \CheckCommand, because it takes \Decl areRobustCommand and optional parameters better into account.

```
1 <*check>
2 \documentclass{article}
3 \makeatletter
\checklatex Optional argument: release date of LATEX.
4 \newcommand*{\checklatex}[1][]{%
5   \typeout{}%
6   \typeout{* Format: 'LaTeX2e' #1}%
7   \typeout{\space\space Loaded: '\fmtname' \fmtversion}%
8 }%
\checkpackage The argument of \checkpackage is the package name without extension optionally followed by a release date.
9 \newcommand*{\checkpackage}[1]{%
10  \def\HyC@package{#1}%
11  \let\HyC@date\empty%
12  \@ifnextchar[\HyC@getDate\HyC@checkPackage
13 }%
\HyC@getDate The release date is scanned.
14 \def\HyC@getDate[#1]{%
15  \def\HyC@date{#1}%
16  \HyC@checkPackage
17 }%
\HyC@checkPackage
18 \def\HyC@checkPackage{%
19  \typeout{}%
20  \begingroup
21  \edef\x{\endgroup
22  \noexpand\RequirePackage{\HyC@package}%
23  \ifx\HyC@date\empty\relax\else[\HyC@date]\fi%
24 }%
25 \x
26 \typeout{}%
27 \typeout{%
28  * Package '\HyC@package'%
29  \ifx\HyC@date\empty
30  \else
31  \space\HyC@date
32  \fi
33 }%
34 \@ifundefined{ver@\HyC@package.sty}{%
35 }{%
36  \typeout{%
37   \space\space Loaded: '\HyC@package' %
38   \csname ver@\HyC@package.sty\endcsname
39 }%
40 }%
41 }
```

\checkcommand The macro \checkcommand parses the next tokens as a L^AT_EX definition and compares this definition with the current meaning of that command.

```

42 \newcommand*\checkcommand[1]{%
43   \begingroup
44   \ifx\long#1\relax
45     \expandafter\HyC@checklong
46   \else
47     \def\HyC@defcmd{\#1}%
48     \expandafter\let\expandafter\HyC@next
49       \csname HyC@\expandafter\@gobble\string#1\endcsname
50     \expandafter\HyC@checkcommand
51   \fi
52 }

```

\HyC@checklong The definition command \def or \edef is read.

```

53 \def\HyC@checklong#1{%
54   \def\HyC@defcmd{\long#1}%
55   \expandafter\let\expandafter\HyC@next
56     \csname HyC@\expandafter\@gobble\string#1\endcsname
57   \HyC@checkcommand
58 }

```

\HyC@checkcommand The optional star of L^AT_EX's definitions is parsed.

```

59 \def\HyC@checkcommand{%
60   \ifx\HyC@next\relax
61     \PackageError{hycheck}{%
62       Unknown command `\\expandafter\\strip@prefix\\meaning\\HyC@cmd'%
63     }{\@ehd
64     \expandafter\endinput
65   \fi
66   \@ifstar{%
67     \def\HyC@star{*}%
68     \HyC@check
69   }{%
70     \let\HyC@star\@empty
71     \HyC@check
72   }%
73 }

```

\HyC@check The macro \HyC@check reads the definition command.

```

74 \def\HyC@check#1{%
75   \def\HyC@cmd{\#1}%
76   \let\HyC@org@cmd\#1%
77   \let#1\relax
78   \let\HyC@param\@empty
79   \HyC@Toks{}%
80   \let\HyC@org@optcmd\HyC@noValue
81   \let\HyC@org@robustcmd\HyC@noValue
82   \let\HyC@org@robustoptcmd\HyC@noValue
83   \HyC@next
84 }

```

\HyC@noValue

```
85 \def\HyC@noValue{NoValue}
```

\HyC@newcommand The code for \newcommand.

```

86 \def\HyC@newcommand{%
87   \let\HyC@cmd\HyC@cmd
88   \@ifnextchar[\HyC@nc@opt\HyC@nc@noopt
89 }

```

\HyC@Toks A register for storing the default value of an optional argument.

```
90 \newtoks\HyC@Toks
```

\HyC@nc@noopt This macro \HyC@nc@noopt is called, if the parser has reached the definition text.

```

91 \long\def\HyC@nc@noopt#1{%
92   \edef\x{%
93     \expandafter\noexpand\HyC@defcmd
94     \HyC@star
95     \expandafter\noexpand\HyC@cmd
96     \HyC@param\the\HyC@Toks
97   }%
98   \x{#1}%
99   \HyC@doCheck
100 }

```

\HyC@nc@opt This macro scans the first optional argument of a L^AT_EX definition (number of arguments).

```

101 \def\HyC@nc@opt[#1]{%
102   \def\HyC@param{[#1]}%
103   \@ifnextchar[\HyC@nc@default\HyC@nc@noopt
104 }

```

\HyC@nc@default Macro \HyC@nc@default scans the default for an optional argument.

```

105 \def\HyC@nc@default[#1]{%
106   \HyC@Toks={[{#1}]}%
107   \edef\HyC@optcmd{%
108     \expandafter\noexpand
109     \csname\expandafter\string\HyC@cmd\endcsname
110   }%
111   \expandafter\let\expandafter\HyC@org@optcmd\HyC@optcmd
112   \HyC@nc@noopt
113 }

```

\HyC@DeclareRobustCommand \DeclareRobustCommand{\cmd} makes the command \cmd robust, that then calls \cmd with an space at the end of the command name, defined by \newcommand. Therefore the further parsing is done by \HyC@nc@opt or \HyC@nc@noopt of the \HyC@newcommand chain.

```

114 \def\HyC@DeclareRobustCommand{%
115   \edef\HyC@robustcmd{%
116     \expandafter\noexpand
117     \csname\expandafter\expandafter\expandafter\@gobble
118     \expandafter\string\HyC@cmd\space\endcsname
119   }%
120   \expandafter\let\expandafter\HyC@org@robustcmd\HyC@robustcmd
121   \expandafter\let\HyC@robustcmd\relax
122   \let\HyC@cmd\HyC@robustcmd
123   \@ifnextchar[\HyC@nc@opt\HyC@nc@noopt
124 }

```

\HyC@def The parameter text of \def or \edef is stored in the token register \HyC@Toks.

```

125 \def\HyC@def#1{%
126   \HyC@Toks={#1}%

```

```

127   \HyC@nc@noopt
128 }
129 \let\HyC@edef\HyC@def

```

\HyC@doCheck This command performs the checks and prints the result.

```

130 \def\HyC@doCheck{%
131   \typeout{* Checking '\HyC@string\HyC@cmd':}%
132   \HyC@checkItem{cmd}%
133   \HyC@checkItem{robustcmd}%
134   \HyC@checkItem{optcmd}%
135   \HyC@checkItem{robustoptcmd}%
136   \endgroup
137 }

```

\HyC@checkItem A single check.

```

138 \def\HyC@checkItem#1{%
139   \expandafter\ifx\csname HyC@org@#1\endcsname\HyC@noValue
140   \else
141     \expandafter\expandafter\expandafter\ifx
142       \csname HyC@#1\expandafter\endcsname
143       \csname HyC@org@#1\endcsname
144         \expandafter\HyC@checkOk\csname HyC@#1\endcsname
145   \else
146     \expandafter\HyC@checkFailed
147       \csname HyC@#1\expandafter\endcsname
148       \csname HyC@org@#1\endcsname
149   \fi
150 \fi
151 }

```

\HyC@string Some shorthands.

\HyC@meaning

```

152 \def\HyC@string#1{\expandafter\string#1}
153 \def\HyC@meaning#1{\expandafter\meaning#1}

```

\HyC@checkOk The result, if the check succeeds.

```

154 \def\HyC@checkOk#1{%
155   \typeout{\space\space`\\HyC@string#1' ok.}}

```

\HyC@checkFailed The result, if the check fails.

```

156 \def\HyC@checkFailed#1#2{%
157   \typeout{\space\space`\\HyC@string#1' failed.}%
158   \typeout{\space\space* original: \meaning#2}%
159   \typeout{\space\space* expected: \HyC@meaning#1}%
160 }

161 % ****
162 </check>
163 <*package>

```

4 Package options and setup

4.1 Save catcodes

There are many packages that change the standard catcodes.

First we save the original meaning of ` and = in the token register \toks@, because we need the two characters in the macros \Hy@SetCatcodes and \Hy@RestoreCatcodes.

```

164 \begingroup
165   \@makeother`%
166   \@makeother=%
167   \edef\x{%
168     \edef\noexpand\x{%
169       \endgroup
170       \noexpand\toks@{%
171         \catcode 96=\noexpand\the\catcode`\noexpand\`relax
172         \catcode 61=\noexpand\the\catcode`\noexpand=relax
173       }%
174     }%
175     \noexpand\x
176   }%
177 \x
178 \@makeother`%
179 \@makeother=

\Hy@SetCatcodes

180 \def\Hy@SetCatcodes{%
181   \@makeother`%
182   \@makeother=%
183   \catcode`\$=3
184   \catcode`\&=4
185   \catcode`\^=7
186   \catcode`\_=8
187   \atmakeother\%
188   \atmakeother:%
189   \atmakeother\(%
190   \atmakeother\)%
191   \atmakeother\[%
192   \atmakeother\]%
193   \atmakeother\//%
194   \atmakeother\!%
195   \atmakeother\<%
196   \atmakeother\>%
197   \atmakeother\.%%
198   \atmakeother\;%%
199   \atmakeother+%
200   \atmakeother-%
201   \atmakeother"%
202   \atmakeother'%
203 }

\Hy@RestoreCatcodes

204 \begingroup
205   \def\x#1{\catcode`\noexpand#1=\the\catcode`\#1\relax}%
206   \xdef\Hy@RestoreCatcodes{%
207     \the\toks@
208     \$%
209     &%
210     ^%
211     _%
212     !%
213     :%
214     (%

```

```

215      \x\)%
216      \x\[%
217      \x\]%
218      \x\/%
219      \x\!%
220      \x\<%
221      \x\>%
222      \x\.%
223      \x\;%
224      \x\+%
225      \x\-%
226      \x\%"%
227      \x\'%%
228  }%
229 \endgroup

```

230 \Hy@SetCatcodes

It needs the December 95 release of L^AT_EX, because it uses \protected@wri te, and it defines commands in options; and the page setup internal code changed at that point. It'll probably break with the later releases!

```

231 \RequirePackage{keyval}[1997/11/10]
232 \def\Hy@Warning#1{\PackageWarning{hyperref}{#1}}
233 \def\Hy@WarningNoLine#1{\PackageWarningNoLine{hyperref}{#1}}
234 \def\Hy@Info#1{\PackageInfo{hyperref}{#1}}

```

4.2 Compatibility with format dumps

\AfterBeginDocument For use with pre-compiled formats, created using the l dump package, there needs to be 2 hooks for adding material delayed until \begin{document}. These are called \AfterBeginDocument and \AtBeginDocument. If l dump is not loaded, then a single hook suffices for normal L^AT_EX processing.

The default definition of \AfterBeginDocument cannot be done by \let because of problems with xypic.

```

235 \@ifundefined{AfterBeginDocument}{%
236   \def\AfterBeginDocument{\AtBeginDocument}%
237 }{}%

```

4.3 Switches

```

238 \newif\ifHy@typexml

5 Common help macros

\Hy@StepCount
314 \def\Hy@StepCount#1{\advance#1 by 1 }%

\Hy@GlobalStepCount
315 \def\Hy@GlobalStepCount#1{\global\advance#1 by 1 }%

316 \newdimen\@linkdim
317 \let\Hy@driver\@empty
318 \let\MaybeStopEarly\relax
319 \newcount\Hy@linkcounter
320 \newcount\Hy@pagecounter
321 \Hy@linkcounter0
322 \Hy@pagecounter0

```

5.1 Macros for recursions

\Hy@ReturnAfterElseFi
\Hy@ReturnAfterFi

The commands \Hy@ReturnAfterElseFi and \Hy@ReturnAfterFi avoid a too deep \if-nesting especially for recursive macros.

```

323 \long\def\Hy@ReturnAfterElseFi#1\else#2\fi{\fi#1}
324 \long\def\Hy@ReturnAfterFi#1\fi{\fi#1}

```

5.2 Babel's protection of shorthand characters

\Hy@safe@activestrue
\Hy@safe@activesfalse

Babel's switch setting commands cannot be used directly, because they can be undefined if babel is not loaded.

```

325 \def\Hy@safe@activestrue{\csname safe@activestrue\endcsname}
326 \def\Hy@safe@activesfalse{\csname safe@activesfalse\endcsname}

```

5.3 Coordinate transformations

At some places numbers in pdf units are expected (eg: FitBH, ...). The following macros perform the transformation from TeX units (pt) to PDF units (bp).

- \hypercalcbp
- The user macro \hypercal cbp can be used, for example, inside option values:
- ```
pdfstartview={FitBH \hypercalcbp{\paperheight-\topmargin-1in}}
```
- It cannot be used inside \usepackage, because LaTeX expands the options before package hyperref is loaded and \hypercal cbp is defined.
  - With e-TeX extensions an expandable implementation is very easy; \hypercal cbp can be used everywhere and is expanded at use.
  - Without e-TeX's features \hypercal cbp cannot be implemented expandable (practically) and have to be supported by \hypercal cbpdef. Limitations:
    - Works only in options that use \hypercal cbpdef (currently only pdfstartview).
    - For calculations package calc has to be loaded.
    - The expansion of the argument is done at definition time.

Example (TeX):

```
\usepackage{calc}
\usepackage[...]{hyperref}
\hypersetup{
 pdfstartview={FitBH \hypercalcbp{\paperheight-\topmargin-1in
 -\headheight-\headsep}}
}

\hypercalcbp

```

## 6 Dealing with PDF strings

The PDF string stuff done by Heiko Oberdiek.  
Email: oberdi ek@uni-freiburg.de.

Naming convention: All internal commands that are only needed by \pdfstringdef are prefixed with \HyPsd@.

## 6.1 Description of PDF strings

The PDF specification defines several places to hold text strings (bookmark names, document information, text annotations, etc.). The PDF strings have following properties:

- They are surrounded by parentheses. The hexadecimal form is not supported.
- Like PostScript language strings they use the same escaping mechanism:

|                              |                                      |
|------------------------------|--------------------------------------|
| \\"\\                        | the backslash itself                 |
| \\"), \\"(                   | unbalanced parentheses               |
| \\"n, \\"r, \\"t, \\"b, \\"f | special white space escape sequences |
| \\"ddd                       | octal character code <i>ddd</i>      |
- Strings are stored either in PDFDocEncoding, which is a superset of ISOLatin1 and is compatible with Unicode with character codes below 256, or in Unicode.

## 6.2 Definition of \pdfstringdef

The central macro for dealing with PDF strings is \pdfstringdef. It defines a command #1 to be the result of the conversion from the string in #2 to a legal PDFDocEncoded string. Currently the definition is global, but this can be changed in the future.

Important: In  $\text{\TeX}$ 's view PDF strings are written to a file and are expanded only in its mouth. Stomach commands that cannot be expanded further aren't executed, they are written verbatim. But the PDF reader that reads such a string isn't a  $\text{\TeX}$  interpreter!

The macro \pdfstringdef consists of three main parts:

1. Preprocessing. Here the expansion is prepared. The encoding is set and many commands are redefined, so that they work appropriate.
2. Expansion. The  $\text{\TeX}$  string is expanded the first time to get a PDF string.
3. Postprocessing. The result of the expansion is checked and converted to the final form.

\pdfstringdef \pdfstringdef works on the tokens in #2 and converts them to a PDF string as far as possible:

- The result should obey the rules of the PDF specification for strings.
- The string can safely processed by  $\text{\TeX}$ , because the tokens have only catcodes 10 until 12.

The result is stored in the command token given in #1.

368 \def\pdfstringdef#1#2{%

Many redefinitions are needed, so all the work is done in a group.

369 \begingroup

### 6.2.1 Preprocessing

**Octal escape sequences.** To avoid problems with eight bit or non printable characters, the octal escape notation is supported. So most glyphs in the encoding definitions for PD1 and PU produce these octal escape sequences. All three octal digits have to be used:

- Wrong results are avoided, if digits follow that are not part of the octal sequence.
- Macros rely on the fact that the octal sequences always consist of three digits (vtex driver, Unicode support).

The escape sequences start with a backslash. By `\string` it will be printed. Therefore it is ensured that the `\TeX` escape character indeed prints as a normal backslash. Eventually this line can be removed, because this is standard `\TeX` behaviour.

```
370 \escapechar`\\%
```

From the view of `\TeX` a octal sequence consists of the command tokens `\0` until `\3` and two digits. For saving tokens `\0`, `\1`, `\2`, and `\3` are directly used without a preceding `\string` in the glyph definitions. This is done here locally by defining the `\0` until `\3` commands. So the user can use octal escape sequences directly, the disadvantage is that a previous definition of this short commands does not apply.

```
371 \edef\0{\string\0}%
372 \edef\1{\string\1}%
373 \edef\2{\string\2}%
374 \edef\3{\string\3}%
```

**Setting font encoding.** The unicode encoding uses `\8` and `\9` as marker for the higher byte. `\8` is an abbreviation for the higher bytes 0 until 7 that can be expressed by one digit. `\8` will be converted to `\00`. However `\9` only marks the next three digits as higher byte and will be removed later.

The encoding is set by `\enc@update` for optimizing reasons.

```
375 \ifHy@unicode
376 \edef\8{\string\8}%
377 \edef\9{\string\9}%
378 \fontencoding{PU}%
379 \HyPsd@UTFviii
380 \else
381 \fontencoding{PD1}%
382 \fi
383 \enc@update
```

**Internal encoding commands.** `\pdfstringdef` interpretes text strings which are not allowed to contain mathematical stuff. The text glyph commands will produce a warning, if called in math mode. But this warning disturbs while expanding. Therefore we check for math mode here, before `\inmathwarn` will be disabled (see below).

```
384 \inmathwarn\pdfstringdef
```

If a glyph is used, that isn't in the PD1/PU encoding there will be an infinite error loop, because the NFSS encoding stuff have to be expanded unprotected (`\edef`), so that the assignments of `\@changed@cmd` don't take place. To patch this behaviour I only found `\inmathwarn` as a usable hook. While an `\edef` a warning message by `\inmathwarn` or `\TextSymbol{Unavailabl e}` cannot be give out, so `\inmathwarn` should be disabled. And with the help of it the assignments in `\@changed@cmd` can easily be caught (see below).

```
385 \let\inmathwarn\HyPsd@inmathwarn
```

Unknown composite characters are built with `\add@accent`, so it is redefined to provide a warning.

```
386 \let\add@accent\HyPsd@add@accent
```

**Commands that don't use NFSS directly.** There are several commands that prints characters in the printable ASCII area that don't obey the NFSS, so they have to be redefined here.

```
387 \let\{\textbraceleft
388 \let\}\textbraceright
389 \let\\textbackslash
390 \let#\textnumbersign
391 \let$\textdollar
392 \let%textpercent
393 \let&textampersand
394 % \let~\textasciitilde
395 \let_textunderscore
396 \let\P{textparagraph}
397 \let\ldots{textellipsis}
398 \let\dots{textellipsis}
```

**Newline** `\newline` or `\\"` do not work in bookmarks, in text annotations they should expand to `\r`. In pdf strings `\\"` stands for a backslash. Therefore the commands are disabled now. The user can redefine them for a result what he want:

**backslash:** `\pdfstringdefDisableCommands{\let\\textbackslash}`

**new line:** `\pdfstringdefDisableCommands{\let\\textCR}`

**disabled:** `\pdfstringdefDisableCommands{\let\\empty}`

At any case, however, the optional argument or the star cannot be scanned in a 100% sure manner.

```
399 \def\\{\pdfstringdefWarn\\}%
400 \def\newline{\pdfstringdefWarn\newline}%
```

**Logos.** Because the box shifting used in the `\TeX` logo does not work while writing to a file, the standard `\TeX` logos are redefined.

```
401 \def\TeX{\TeX}%
402 \def\LaTeX{\LaTeX}%
403 \def\LaTeXe{\LaTeXe}%
404 \def\cTeX{\cTeX}%
405 \def\MF{\MF}%
406 \def\MP{\MP}%
```

**Standard font commands.** Because font changes do not work, the standard font switching commands are disabled.

```
407 \let\emph@\firstofone
408 \let\textbf@\firstofone
409 \let\textit@\firstofone
410 \let\textmd@\firstofone
411 \let\textnormal@\firstofone
412 \let\textrm@\firstofone
413 \let\textsc@\firstofone
414 \let\textsf@\firstofone
415 \let\textsl@\firstofone
```

```

416 \let\texttt{\@firstofone
417 \let\textup{\@firstofone
418 \let\ttfamily{\@empty
419 \let\sffamily{\@empty
420 \let\itshape{\@empty
421 \let\upshape{\@empty
422 \let\bfseries{\@empty
423 \let\rm{\@empty
424 \let\Huge{\@empty
425 \let\LARGE{\@empty
426 \let\Large{\@empty
427 \let\footnotesize{\@empty
428 \let\huge{\@empty
429 \let\large{\@empty
430 \let\normalsize{\@empty
431 \let\scriptsize{\@empty
432 \let\small{\@empty
433 \let\tiny{\@empty

```

#### Package color.

```
434 \def\textcolor##1##{\@secondoftwo}{%
```

**Package babel.** Wherever “naturalnames” is used, disable \textlatin (from Babel 3.6k). Thanks to Felix Neubauer (Email: Felix.Neubauer@gmx.net).

```

435 \let\textlatin{\@firstofone
436 \@ifundefined{language@group}{}{%
437 \csname HyPsd@babel@\language@group\endcsname
438 }%
439 \let\@safe@activestrue\relax
440 \let\@safe@activesfalse\relax
 Disable \cyr, used in russianb.ldf.
441 \let\cyr\relax
 Redefine \es@roman, used in spanish.ldf.
442 \let\es@roman\Roman

```

#### Package german.

```

443 \let\glqq\textglqq
444 \let\grqq\textgrqq
445 \let\glq\textglq
446 \let\grq\textgrq
447 \let\fllqq\textfllqq
448 \let\frrqq\textfrrqq
449 \let\fllq\textfllq
450 \let\frq\textfrq

```

**Package french.** The support is deferred, because it needs \GenericError to be disabled (see below).

**Package FrenchPro.** This package uses:

```
\iffalse@expandable{not fully expandable code}{fully expandable code}
451 \let\ifmid@expandable\@firstoftwo
```

### AMS classes.

```
452 \HyPSD@AMSclassfix
```

**Redefinition of \hspace** \hspace don't work in bookmarks, the following fix tries to set a space if the argument is a positive length.

```
453 \let\hspace\HyPsd@hspace
```

**Commands of referencing and indexing systems.** Some L<sup>A</sup>T<sub>E</sub>X commands that are legal in \section commands have to be disabled here.

```
454 \let\label@gobble
455 \let\index@gobble
456 \let\glossary@gobble
457 \let\href@secondoftwo
```

The \ref and \pageref is much more complicate because of their star form.

```
458 \let\ref\HyPsd@ref
459 \let\pageref\HyPsd@pageref
```

Also we need an expandable form of \autoref. Babel's shorthands are not supported inside the reference label.

```
460 \def\HyPsd@ar@get##1##2@nil{##1}%
461 \def\HyPsd@ar@tmp##1{%
462 \expandafter\expandafter\expandafter\HyPsd@ar@get
463 \expandafter\fourthoffive##1\empty\empty.\empty\empty
464 }%
465 \def\auto@setref##1##2##3{%
466 \ifx##1\relax
467 \else
468 \csname\HyPsd@ar@tmp{##1}%
469 \expandafter\ifx\csname\HyPsd@ar@tmp{##1}autorefname\endcsname
470 \relax
471 \else
472 autoref%
473 \fi
474 name%
475 \endcsname
476 \space
477 \expandafter##2##1\empty\empty\empty
478 \fi
479 }%
```

### Miscellaneous commands.

```
480 \let\leavevmode\empty
481 \let\mbox\empty
```

\halign causes error messages because of the template character #.

```
482 \def\halign{\pdfstringdefWarn\halign\gobble}%
```

### Patch for cjk bookmarks.

```
483 \ifHy@CJKbookmarks
484 \HyPsd@CJKhook
485 \fi
```

**User hook.** The switch `\Hy@pdfstring` is turned on. So user commands can detect that they are processed not to be typesetted within  $\text{\TeX}$ 's stomach, but to be expanded by the mouth to give a PDF string. At this place before interpreting the string in #2 additional redefinitions can be added by the hook `\pdfstringdefPreHook`.

The position in the middle of the redefinitions is a compromise: The user should be able to provide his own (perhaps better) redefinitions, but some commands should have their original meaning, because they can be used in the hook (`\bgroup`, or `\@protected@testopt`, and `\@ifnextchar` for `\renewcommand`).

```
486 \Hy@pdfstringtrue
487 \pdfstringdefPreHook
```

**Spaces.** For checking the token of the string, spaces must be masked, because they cannot be caught by undelimited arguments.

```
488 \HyPsd@LetUnexpandableSpace\space
489 \HyPsd@LetUnexpandableSpace\ %
490 \HyPsd@LetUnexpandableSpace~%
491 \HyPsd@LetUnexpandableSpace\nobreakspace
```

### Package `xspace`.

```
492 \@ifundefined{@xspace}{%
493 \let\xspace\HyPsd@ITALCORR
494 }{%
495 \let\xspace\HyPsd@XSPACE
496 }%
497 \let/\@HyPsd@ITALCORR
498 \let\bgroup\%
499 \let\egroup\%
```

**Redefinitions of miscellaneous commands.** Hyphenation does not make sense.

```
500 \let\discretionary@gobbletwo
\@ifstar is defined in \LaTeX as follows:
```

```
\def\@ifstar#1{\@ifnextchar *{\@firstoftwo{#1}}{}}
```

`\@ifnextchar` doesn't work, because it uses stomach commands like `\let` and `\futurelet`. But it doesn't break. Whereas `\@firstoftwo{#1}` gives an error message because `\@firstoftwo` misses its second argument.

A mimicry of `\@ifnextchar` only with expandible commands would be very extensive and the result would be only an approximation. So here a cheaper solution follows in order to get rid of the error message at least:

```
501 \let\@ifnextchar\HyPsd@ifnextchar
502 \let\@ifnextchar\HyPsd@new@ifnextchar
503 \let\@protected@testopt\HyPsd@protected@testopt
```

### 6.2.2 Expansion

There are several possibilities to expand tokens within  $\text{\TeX}$ :

`\protected@edef`: The weakest form isn't usable, because it does not expand the font encoding commands. They are made robust and protect themselves.

`\csname`: First the string is expanded whithin a `\csname` and `\endcsname`. Then the command name is converted to characters with catcode 12 by `\string` and the first escape character removed by `\@gobble`. This method has the great *advantage*

that stomach tokens that aren't allowed in PDF strings are detected by  $\text{\TeX}$  and reported as errors in order to force the user to write correct things. So he get no wrong results by forgetting the proofreading of his text. But the *disadvantage* is that old wrong code cannot processed without errors. Mainly the error message is very cryptic and for the normal user hard to understand.  $\text{\TeX}$  provides no way to catch the error caused by  $\backslash\text{csname}$  or allows to support the user with a descriptive error message. Therefore the experienced user had to enable this behaviour by an option `exactdef` in previous versions less or equal 6.50.

`\edef` This version uses this standard form for expansion. It is stronger than  $\text{\LaTeX}$ 's  $\backslash\text{protected@edef}$ . So the font encoding mechanism works and the glyph commands are converted to the correct tokens for PDF strings whith the definitions of the PD1 encoding. Because the protecting mechanism of  $\text{\LaTeX}$  doesn't work within an `\edef`, there are situations thinkable where code can break. For example, assignments and definitions aren't performed and so undefined command errors or argument parsing errors can occur. But this is only a compatibility problem with old texts. Now there are possibilities to write code that gives correct PDF strings (see `\texorpdfstring`). In the most cases unexpandable commands and tokens (math shift, grouping characters) remains. They don't cause an error like with  $\backslash\text{csname}$ . However a PDF reader isn't  $\text{\TeX}$ , so these tokens are viewed verbatim. So this version detects them now, and removes them with an descriptive warning for the user. As additional features `xspace` support is possible and grouping characters can be used without problems, because they are removed silently.

**Generic messages.** While expanding via `\xdef` the `\Generic... messages` don't work and causes problems (error messages, invalid .out file). So they are disabled while expanding and removed silently, because a user warning would be too expensive (memory and runtime, `\pdfstringdef` is slow enough).

```
504 \begingroup
505 \let\GenericError\@gobblefour
506 \let\GenericWarning\@gobbletwo
507 \let\GenericInfo\@gobbletwo
```

**Package french.** This fix only works, if `\GenericError` is disabled.

```
508 \ifx\nofrenchguillemets\@undefined
509 \else
510 \nofrenchguillemets
511 \fi
```

**Definition commands and expansion.** Redefining the defining commands (see sec. 6.5.10). The original meaning of `\xdef` is saved in `\Hy@temp`.

```
512 \let\Hy@temp\xdef
513 \let\def\HyPsd@DefCommand
514 \let\gdef\HyPsd@DefCommand
515 \let\edef\HyPsd@DefCommand
516 \let\xdef\HyPsd@DefCommand
517 \let\futurelet\HyPsd@LetCommand
518 \let\let\HyPsd@LetCommand
519 \Hy@temp#1{#2}%
520 \endgroup
```

### 6.2.3 Postprocessing

If the string is empty time can be saved by omitting the postprocessing process.

```
521 \ifx#1\empty
522 \else
```

**Protecting spaces and removing grouping characters.** In order to check the tokens we must separate them. This will be done with  $\text{\TeX}$ 's argument parsing. With this method we must the following item takes into account, that makes makes things a litte more complicate:

- $\text{\TeX}$  does not accept a space as an undelimited argument, it cancels space tokens while looking for an undelimited argument. Therefore we must protect the spaces now.
- An argument can be a single token or a group of many tokens. And within curly braces tokens aren't find by  $\text{\TeX}$ 's argument scanning process. Third curly braces as grouping characters cannot be expanded further, so they don't vanish by the string expansion above. So these characters with catcode 1 and 2 are removed in the following and replaced by an marker for the xspace support.
- $\text{\TeX}$  silently removes the outmost pair of braces of an argument. To prevent this on unwanted places, in the following the character | is appended to the string to make an outer brace to an inner one.

First the top level spaces are protected by replacing. Then the string is scanned to detect token groups. Each token group will now be space protected and again scanned for another token groups.

```
523 \HyPsd@ProtectSpaces#1%
524 \let\HyPsd@String\empty
525 \expandafter\HyPsd@RemoveBraces\expandafter{#1}%
526 \global\let#1\HyPsd@String
```

**Check tokens.** After removing the spaces and the grouping characters the string now should only consists of the following tokens/catcodes:

- 0 command names with start with an escape character.
- 3 math shift
- 4 alignment tabs
- 6 parameter, but this is unlikely.
- 7 superscript
- 8 subscript
- 11 letter
- 12 other
- 13 commands that are active characters.

After  $\text{\HyPsd@CheckCatcodes}$  the command  $\text{\HyPsd@RemoveMask}$  is reused to remove the group protection character |. This character is needed to ensure that the string at least consists of one token if  $\text{\HyPsd@CheckCatcodes}$  is called.

Because of internal local assignments and tabulars group braces are used.

```
527 \let\HyPsd@SPACEOPTI\relax
528 {%
529 \let\HyPsd@String\empty
530 \expandafter\HyPsd@CheckCatcodes#1\HyPsd@End
531 \global\let#1\HyPsd@String
532 }%
533 \expandafter\HyPsd@RemoveMask\expandafter
534 |\expandafter\empty#1\HyPsd@End#1%
```

\HyPsd@CheckCatcodes should no have removed the tokens with catcode 3, 4, 7, and 8. Because a parameter token (6) would cause to many errors before, there should now be only tokens with catcodes 11 or 12. So I think there is no need for a safety step like:

```
\xdef#1{\expandafter\strip@prefix\meaning#1}%
```

**Looking for wrong glyphs.** The case that glyphs aren't defined in the PD1 encoding is caught above in such a way, that the glyph name and a marker is inserted into the string. Now we can safely scan the string for this marker and provide a descriptive warning.

```
535 \expandafter\HyPsd@Subst\expandafter{\HyPsd@GLYPHERR}{\relax}#1%
536 \let\HyPsd@String\empty
537 \expandafter\HyPsd@GlyphProcess#1\relax\empty
538 \global\let#1\HyPsd@String
```

**Backslash.** The double backslash disturbs parsing octal sequences, for example in an string like abc\\051 the sequence \051 is detected although the second \ belongs to the first backslash.

```
539 \HyPsd@StringSubst{\\"}{\textbackslash}#1%
```

**Spaces.** All spaces have already the form \040. The last postprocessing step will be an optimizing of the spaces, so we already introduce already the necessary command \HyPsd@SPACEOPTI. But first it is defined to be \relax in order to prevent a too early expansion by an \edef. Secondly a \relax serves as a marker for a token that is detected by \xspace.

The code of frenchb.l df can produce an additional space before \gui || emotright, because \lastskip and \unskip do not work. Therefore it is removed here.

```
540 \ifHy@unicode
541 \expandafter\HyPsd@StringSubst\csname 80\040\endcsname
542 \HyPsd@SPACEOPTI#1%
543 \edef\Hy@temp@A{\HyPsd@SPACEOPTI\HyPsd@SPACEOPTI\80\273}%
544 \expandafter\HyPsd@Subst\expandafter{\Hy@temp@A}%
545 \f\HyPsd@SPACEOPTI\80\273}#1%
546 \else
547 \HyPsd@StringSubst{\040}\HyPsd@SPACEOPTI#1%
548 \expandafter\HyPsd@Subst\expandafter{%
549 \expandafter\HyPsd@SPACEOPTI\expandafter\HyPsd@SPACEOPTI
550 \string\273}\f\HyPsd@SPACEOPTI\273}#1%
551 \fi
```

**Right parenthesis.** Also \xspace detects a right parenthesis. For the \xspace support and the following parenthesis check the different parenthesis notations ), \), and \051 are converted to one type \) and before \HyPsd@empty with the meaning of \relax is introduced for \xspace. By redefining to \empty \HyPsd@empty can easily removed later.

```
552 \ifHy@unicode
553 \HyPsd@StringSubst{\)}{\80\051}#1%
554 \HyPsd@Subst{\80\051}#1%
555 \let\HyPsd@empty\relax
556 \expandafter\HyPsd@StringSubst\csname 80\051\endcsname
557 \f\HyPsd@empty\80\051}#1%
558 \else
559 \HyPsd@StringSubst{\)}{\051}#1%
560 \HyPsd@Subst{\051}#1%
561 \let\HyPsd@empty\relax
```

```

562 \HyPsd@StringSubst{\051}{\HyPsd@empty$string\}}#1%
563 \fi

```

**Support for package xspace.** `\xspace` looks for the next token and decides if it expands to a space or not. Following tokens prevent its transformation to a space: Beginning and end of group, handled above by replacing by an italic correction, several punctuation marks, a closing parentheses, and several spaces.

Without package `xspace` there are tokens with catcode 11 and 12, `\HyPsd@empty` and `\HyPsd@SPACEOPTI`. With package `xspace` marker for the italic correction `\V` and `\xspace` come with. In the package `xspace` case the two markers are replaced by commands and an `\edef` performs the `\xspace` processing.

In the opposite of the original `\xspace` `\HyPsd@xspace` uses an argument instead of a `\futurelet`, so we have to provide such an argument, if `\HyPsd@xspace` comes last. Because `\HyPsd@Subst` with several equal tokens (--) needs a safe last token, in both cases the string gets an additional `\HyPsd@empty`.

```

564 \expandafter\HyPsd@Subst\expandafter{/\}\HyPsd@empty#1%
565 \c@ifundefined{@xspace}%
566 }%{
567 \let\HyPsd@xspace\relax
568 \expandafter\HyPsd@Subst\expandafter
569 {\HyPsd@XSPACE}\HyPsd@xspace#1%
570 \let\HyPsd@xspace\HyPsd@doxspace
571 }%
572 \xdef#1{\HyPsd@empty}%

```

**Ligatures.** `\TeX` forms ligatures in its stomach, but the PDF strings are treated only by `\TeX`'s mouth. The PDFDocEncoding contains some ligatures, but the current version 3 of the AcrobatReader lacks the `fi` and `fl` glyphs, and the Linux version lacks the emdash and endash glyphs. So the necessary code is provided here, but currently disabled, hoping that version 4 of the AcrobatReader is better. To break the ligatures the user can use an empty group, because it leads to an insertion of an `\HyPsd@empty`. If this ligature code will be enabled some day, then the italic correction should also break the ligatures. Currently this occurs only, if package `xspace` is loaded.

```

573 % \HyPsd@Subst{--}\textemdash#1%
574 % \HyPsd@Subst{--}\textendash#1%
575 % \HyPsd@Subst{fi}\textfi#1%
576 % \HyPsd@Subst{fl}\textfl#1%
577 % \HyPsd@Subst{!'}\textexclamdown#1%
578 % \HyPsd@Subst{?'}\textquestiondown#1%

```

With the next `\edef` we get rid of the token `\HyPsd@empty`.

```

579 \let\HyPsd@empty\@empty

```

**Left parentheses.** Left parentheses are now converted to safe forms to avoid problems with unmatched ones (`\(`` with PDFDocEncoding, the octal sequence with Unicode).

An optimization is possible. Matched parentheses can replaced by a `( )` pair. But this code is removed to save `\TeX` memory and time.

```

580 \ifHy@unicode
581 \HyPsd@StringSubst{(\textparenleft\#1%
582 \HyPsd@Subst{(\textparenleft\#1%
583 \else
584 \HyPsd@StringSubst{(\050\#1%
585 \HyPsd@Subst{(\050\#1%
586 \HyPsd@StringSubst{\050{\string\()\#1%

```

```
587 \fi
```

**Optimizing spaces.** Spaces are often used, but they have a very long form `\040`. They are converted back to real spaces, but not all, so that no space follows after another. In the bookmark case several spaces are written to the `.out` file, but if the entries are read back, several spaces are merged to a single one.

With Unicode the spaces are replaced by their octal sequences.

```
588 \ifHy@unicode
589 \edef\HyPsd@SPACEOPTI{\80\040}%
590 \else
591 \let\HyPsd@SPACEOPTI\HyPsd@spaceopti
592 \fi
593 \xdef#1{\#1\@empty}%
594 \fi
```

**Converting to Unicode.** At last the eight bit letters have to be converted to Unicode, the masks `\8` and `\9` are removed and the Unicode marker is added.

```
595 \ifHy@unicode
596 \HyPsd@ConvertToUnicode#1%
597 \fi
```

**User hook.** The hook `\pdfstringdefPostHook` can be used for the purpose to post-process the string further.

```
598 \pdfstringdefPostHook#1%
599 \endgroup
600 }
```

## 6.3 Encodings

### 6.3.1 PD1 encoding

The PD1 encoding implements the PDFDocEncoding for use with L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub> 's NFSS. Because the informational strings are not set by T<sub>E</sub>X's typesetting mechanism but for interpreting by the PDF reader, the glyphs of the PD1 encoding are implemented to be safely written to a file (PDF output file, `.out` file).

The PD1 encoding can be specified as an option of the 'fontenc' package or loaded here. It does not matter what font family is selected, as T<sub>E</sub>X does not process it anyway. So use CM.

```
601 \@ifundefined{T@PD1}{\input{pd1enc.def}}{}
602 \DeclareFontFamily{PD1}{pdf}{}%
603 \DeclareFontShape{PD1}{pdf}{m}{n}{<->cmr10}{}%
604 \DeclareFontSubstitution{PD1}{pdf}{m}{n}
```

### 6.3.2 PU encoding

The PU encoding implements the Unicode encoding for use with L<sup>A</sup>T<sub>E</sub>X's NFSS. Because of large memory requirements the encoding file for Unicode support is only loaded, if option `uni code` is specified as package option.

`\HyPsd@InitUnicode` Because the file `puenc.def` takes a lot of memory, the loading is defined in the macro `\HyPsd@InitUnicode` called by the package option `uni code`.

```
605 \def\HyPsd@InitUnicode{%
606 \ifundefined{T@PU}{\input{puenc.def}}{}%
607 \DeclareFontFamily{PU}{pdf}{}%
```

```

608 \DeclareFontShape{PU}{pdf}{m}{n}{ <-> cmr10 }{%
609 \DeclareFontSubstitution{PU}{pdf}{m}{n}%
610 \let\HyPsd@InitUnicode\relax
611 }

```

## 6.4 Additional user commands

### 6.4.1 \texorpdfstring

\texorpdfstring While expanding the string in \pdfstringdef the switch \ifHy@pdfstring is set. This is used by the full expandible macro \texorpdfstring. It expects two arguments, the first contains the string that will be set and processed by  $\text{\TeX}$ 's stomach, the second contains the replacement for PDF strings.

```

612 \newcommand*{\texorpdfstring}{%
613 \ifHy@pdfstring
614 \expandafter\@secondoftwo
615 \else
616 \expandafter\@firstoftwo
617 \fi
618 }

```

### 6.4.2 Hooks for \pdfstringdef

\pdfstringdefPreHook \pdfstringdefPostHook Default definition of the hooks for \pdfstringdef. The construct \ifundefined with \let is a little bit faster than \providecommand.

```

619 \@ifundefined{pdfstringdefPreHook}{%
620 \let\pdfstringdefPreHook\@empty
621 }{%
622 \@ifundefined{pdfstringdefPostHook}{%
623 \let\pdfstringdefPostHook\@gobble
624 }{%

```

\pdfstringdefDisableCommands In \pdfstringdefPreHook the user can add code that is executed before the string, that have to be converted by \pdfstringdef, is expanded. So replacements for problematic macros can be given. The code in \pdfstringdefPreHook should not be replaced perhaps by an \renewcommand, because a previous meaning gets lost.

Macro \pdfstringdefDisableCommands avoids this, because it reuses the old meaning of the hook and appends the new code to \pdfstringdefPreHook, e.g.:

```

\pdfstringdefDisableCommands{%
 \let~\textasciitilde
 \def\url{\pdfstringdefWarn\url}%
 \let\textcolor\@gobble
}

```

In the argument of \pdfstringdefDisableCommands the character @ can be used in command names. So it is easy to use useful  $\text{\LaTeX}$  commands like \gobble or \@firstofone.

```

625 \def\pdfstringdefDisableCommands{%
626 \begingroup
627 \makeatletter
628 \HyPsd@DisableCommands
629 }

```

\HyPsd@DisableCommands

```
630 \long\def\HyPsd@DisableCommands#1{%
```

```

631 \toks0=\expandafter{\pdfstringdefPreHook}%
632 \toks1={#1}%
633 \xdef\pdfstringdefPreHook{\the\toks0 \the\toks1}%
634 \endgroup
635 }

```

\pdfstringdefWarn The purpose of \pdfstringdefWarn is to produce a warning message, so the user can see, that something can go wrong with the conversion to PDF strings.

The prefix \<>- is added to the token. \noexpand protects the probably undefined one during the first expansion step. Then \HyPsd@CheckCatcodes can detect the not allowed token, \HyPsd@CatcodeWarning prints a warning message, after \HyPsd@RemovePrefix has removed the prefix.

\pdfstringdefWarn is intended for document authors or package writers, examples for use can be seen in the definition of \HyPsd@ifnextchar or \HyPsd@protected@testopt.

```

636 \def\pdfstringdefWarn#1{%
637 \expandafter\noexpand\csname<>-\string#1\endcsname
638 }

```

## 6.5 Help macros for expansion

### 6.5.1 Babel languages

```

### 6.5.2 CJK bookmarks

- \HyPsd@CJKhook Some internal commands of package cjk are redefined to avoid error messages. For a rudimental support of CJK bookmarks the active characters are redefined so that they print themselves.

After preprocessing of Big5 encoded data the following string for a double-byte character is emitted:

```
``7f<arg1>``7f<arg2>``7f
```

<arg1> is the first byte in the range (always > 0x80); <arg2> is the second byte in decimal notation ( $\geq 0x40$ ).

```

743 \begingroup
744 \catcode"7F=\active
745 \toks@{%
746 \let\CJK@ignorespaces\empty
747 \def\CJK@char#1{\gobbletwo}%

### 6.5.3 \inmathwarn-Patch

\HyPsd@inmathwarn The patch of \inmathwarn is needed to get rid of the infinite error loop with glyphs of other encodings (see the explanation above). Potentially the patch is dangerous, if the code in ltoutenc.dtx changes. Checked with L<sup>A</sup>T<sub>E</sub>X 2 <sub>$\varepsilon$</sub>  versions [1998/06/01] and [1998/12/01]. I expect that versions below [1995/12/01] don't work.

To understand the patch easier, the original code of \@current@cmd and \@changed@cmd

follows (L<sup>A</sup>T<sub>E</sub>X 2<sub>E</sub> release [1998/12/01]). In the normal case `\pdfstringdef` is executed in a context where `\protect` has the meaning of `\@typesetprotect` (= `\relax`).

```

\def\@current@cmd#1{%
 \ifx\protect\@typeset@protect
 \@inmathwarn#1%
 \else
 \noexpand#1\expandafter\@gobble
 \fi}
\def\@changed@cmd#1#2{%
 \ifx\protect\@typeset@protect
 \@inmathwarn#1%
 \expandafter\ifx\csname\cf@encoding\string#1\endcsname\relax
 \expandafter\ifx\csname ?\string#1\endcsname\relax
 \expandafter\def\csname ?\string#1\endcsname{%
 \TextSymbolUnavailable#1%
 }%
 \fi
 \global\expandafter\let
 \csname\cf@encoding\string#1\expandafter\endcsname
 \csname ?\string#1\endcsname
 \fi
 \csname\cf@encoding\string#1%
 \expandafter\endcsname
 \else
 \noexpand#1%
 \fi}
\gdef\TextSymbolUnavailable#1{%
 \@latex@error{%
 Command \protect#1 unavailable in encoding \cf@encoding%
 }\@eha}
\def\@inmathwarn#1{%
 \ifmmode
 \@latex@warning{Command \protect#1 invalid in math mode}%
 \fi}

818 \def\HyPsd@inmathwarn#1#2{%
819 \ifx#2\expandafter
820 \expandafter\ifx\csname\cf@encoding\string#1\endcsname\relax
821 \HyPsd@GLYPHERR
822 \expandafter\@gobble\string#1%
823 >%
824 \expandafter\expandafter\expandafter\HyPsd@EndWithElse
825 \else
826 \expandafter\expandafter\expandafter\HyPsd@GobbleFiFi
827 \fi
828 \else
829 \expandafter#2%
830 \fi
831 }
832 \def\HyPsd@GobbleFiFi#1\fi#2\fi{}{%
833 \def\HyPsd@EndWithElse#1\else{\else{}}
```

#### 6.5.4 `\add@accent-Patch`

Unknown composite characters are built with `\add@accent`, so it is redefined to provide a warning.

```
\HyPsd@add@accent
834 \def\HyPsd@add@accent#1#2{%
835 \HyPsd@GLYPHERR\expandafter\@gobble\string#1+\string#2>%
836 #2%
837 }%
```

### 6.5.5 Unexpandable spaces

\HyPsd@LetUnexpandableSpace In \HyPsd@@ProtectSpaces the space tokens are replaced by not expandable commands, that work like spaces:

- So they can caught by undelimited arguments.
- And they work in number, dimen, and skip assignments.

These properties are used in \HyPsd@CheckCatcodes.

```
838 \def\HyPsd@LetUnexpandableSpace#1{%
839 \expandafter\futurelet\expandafter#1\expandafter\@gobble\space\relax
840 }
```

\HyPsd@UnexpandableSpace \HyPsd@UnexpandableSpace is used in \HyPsd@@ProtectSpaces. In \yPsd@@ProtectSpaces the space tokens are replaced by unexpandable commands \HyPsd@UnexpandableSpace, but that have the effect of spaces.

```
841 \HyPsd@LetUnexpandableSpace\HyPsd@UnexpandableSpace
```

### 6.5.6 Marker for commands

\HyPsd@XSPACE \HyPsd@ITALCORR \HyPsd@GLYPHERR Some commands and informations cannot be utilized before the string expansion and the checking process. Command names are filtered out, so we need another way to transport the information: An unusual # with catcode 12 marks the beginning of the extra information.

```
842 \edef\HyPsd@XSPACE{\string#\string X}
843 \edef\HyPsd@ITALCORR{\string#\string I}
844 \edef\HyPsd@GLYPHERR{\string#\string G}
```

### 6.5.7 \hspace fix

\HyPsd@hspace  
845 \def\HyPsd@hspace#1{\HyPsd@@hspace#1\*\END}

\HyPsd@@hspace \HyPsd@@hspace checks whether \hspace is called in its star form.

900 \expandafter\expandafter\expandafter\@gobble
901 \csname r@#1\endcsname\@nil
902 \fi
903 }
```

### 6.5.10 Redefining the defining commands

Definitions aren't allowed, because they aren't executed in an only expanding context. So the command to be defined isn't defined and can perhaps be undefined. This would causes TeX to stop with an error message. With a deep trick it is possible to define commands in such a context: \csname does the job, it defines the command to be \relax, if it has no meaning.

Active characters cannot be defined with this trick. It is possible to define all undefined active characters (perhaps that they have the meaning of \relax). To avoid side effects this should be done in \pdfstringdef shortly before the \xdef job. But checking and defining all possible active characters of the full range (0 until 255) would take a while. \pdfstringdef is slow enough, so this isn't done.

\HyPsd@DefCommand and \HyPsd@LetCommand expands to the commands \<def>-command and \<let>-command with the meaning of \def and \let. So it is detected by \HyPsd@CheckCatcodes and the command name \<def>-command or \<let>-command should indicate a forbidden definition command.

The command to be defined is converted to a string and back to a command name with the help of \csname. If the command is already defined, \noexpand prevents a further expansion, even though the command would expand to legal stuff. If the command don't have the meaning of \relax, \HyPsd@CheckCatcodes will produce a warning. (The command itself can be legal, but the warning is legitimate because of the position after a defining command.)

The difference between \HyPsd@DefCommand and \HyPsd@LetCommand is that the first one also cancels this arguments, the parameter and definition text. The right side of the \let commands cannot be canceled with an undelimited parameter because of a possible space token after \futurelet.

To avoid unmachted \if... tokens, the cases \let\if... \iftrue and \let\if... \iffalse are checked and ignored.

```

922 \csname ifffalse\endcsname
923 \pdfstringdefWarn\let
924 \expandafter\expandafter\expandafter@gobble
925 \else
926 #2%
927 \expandafter\noexpand
928 \csname##1\expandafter\expandafter\expandafter\endcsname
929 \fi
930 \fi
931 }%
932 }%
933 \expandafter\x\csname <def>-command\expandafter\endcsname
934 \csname <let>-command\endcsname
935 \def\HyPsd@LetCommand#1{%
936 \expandafter\expandafter\expandafter\HyPsd@@LetCommand
937 \expandafter\expandafter\expandafter{%
938 \expandafter@gobble\string#1\empty
939 }%
940 }

```

### 6.5.11 \i fnextchar

\HyPsd@ifnextchar In \pdfstringdef \i fnextchar is disabled via a \let command to save time. First a warning message is given, then the three arguments are canceled. \i fnextchar cannot work in a correct manner, because it uses \futurelet et, but this is a stomach feature, that doesn't work in an expanding context.

```

941 \def\HyPsd@ifnextchar{%
942 \pdfstringdefWarn\@ifnextchar
943 \expandafter\@gobbletwo\@gobble
944 }

```

\HyPsd@new@ifnextchar Package `amsgen.sty` redefines \i fstar using \new*i fnextchar* instead of \i fnextchar. See bug report latex/3662.

```

945 \def\HyPsd@new@ifnextchar{%
946 \pdfstringdefWarn\new@ifnextchar
947 \expandafter\@gobbletwo\@gobble
948 }

```

### 6.5.12 \@protected@testopt i fnextchar

\HyPsd@protected@testopt Macros with optional arguments doesn't work properly, because they call \i fnextchar to detect the optional argument (see the explanation of \HyPsd@i fnextchar). But a warning, that \i fnextchar doesn't work, doesn't help the user very much. Therefore \@protected@testopt is also disabled, because its first argument is the problematic macro with the optional argument and it is called before \i fnextchar.

```

949 \def\HyPsd@protected@testopt#1{%
950 \pdfstringdefWarn#1%
951 \@gobbletwo
952 }

```

## 6.6 Help macros for postprocessing

### 6.6.1 Generic warning.

\HyPsd@Warning For several reasons \space is masked and does not have its normal meaning. But it is used in warning messages, so it is redefined locally:

```
953 \def\HyPsd@Warning#1{%
954 \begingroup
955 \def\space{ }%
956 \Hy@Warning{#1}%
957 \endgroup
958 }
```

### 6.6.2 Protecting spaces

\HyPsd@ProtectSpaces \HyPsd@ProtectSpaces calls with the expanded string \HyPsd@@ProtectSpaces. The expanded string is protected by | at the beginning and end of the expanded string. Because of this there can be no group at the beginning or end of the string and grouping characters are not removed by the call of \HyPsd@@ProtectSpaces.

```
959 \def\HyPsd@ProtectSpaces#1{%
960 \expandafter\HyPsd@@ProtectSpaces
961 \expandafter|\expandafter\@empty#1| \HyPsd@End#1%
962 }
```

\HyPsd@@ProtectSpaces The string can contain command tokens, so it is better to use an \def instead of an \edef.

```
963 \def\HyPsd@@ProtectSpaces#1 #2\HyPsd@End#3{%
964 \ifx\scrollmode#2\scrollmode
965 \HyPsd@RemoveMask#1\HyPsd@End#3%
966 \else
967 \gdef#3{#1\HyPsd@UnexpandableSpace#2}%
968 \Hy@ReturnAfterFi{%
969 \expandafter\HyPsd@@ProtectSpaces#3\HyPsd@End#3%
970 }%
971 \fi
972 }
```

### Remove mask.

\HyPsd@RemoveMask \HyPsd@RemoveMask removes the protecting |. It is used by \HyPsd@@ProtectSpaces and by the code in \pdfstringdef that removes the grouping characters.

```
973 \def\HyPsd@RemoveMask|#1|\HyPsd@End#2{%
974 \toks@\expandafter{#1}%
975 \xdef#2{\the\toks}%
976 }
```

### 6.6.3 Remove grouping braces

\HyPsd@RemoveBraces #1 contains the expanded string, the result will be locally written in command \HyPsd@String.

```
977 \def\HyPsd@RemoveBraces#1{%
978 \ifx\scrollmode#1\scrollmode
979 \else
980 \Hy@ReturnAfterFi{%
981 \HyPsd@@RemoveBraces#1\HyPsd@End{#1}%
982 }%
983 \fi
984 }
```

\HyPsd@@RemoveBraces \HyPsd@@RemoveBraces is called with the expanded string, the end marked by \HyPsd@End, the expanded string again, but enclosed in braces and the string command. The first expanded string is scanned by the parameter text #1#2. By a comparison with the original form in #3 we can decide whether #1 is a single token or a group. To avoid the case that #2 is a group, the string is extended by a | before.

While removing the grouping braces an italic correction marker is inserted for supporting package `xspace` and letting ligatures broken.

Because the string is already expanded, the `\if` commands should disappeared. So we can move some parts out of the argument of `\Hy@ReturnAfterFi`.

```

985 \def\HyPsd@@RemoveBraces#1#2\HyPsd@End#3{%
986 \def\Hy@temp@A{#1#2}%
987 \def\Hy@temp@B{#3}%
988 \ifx\Hy@temp@A\Hy@temp@B
989 \expandafter\def\expandafter\HyPsd@String\expandafter{%
990 \HyPsd@String#1%
991 }%
992 \Hy@ReturnAfterElseFi{%
993 \ifx\scrollmode#2\scrollmode
994 \else
995 \Hy@ReturnAfterFi{%
996 \HyPsd@RemoveBraces{#2}%
997 }%
998 \fi
999 }%
1000 \else
1001 \def\Hy@temp@A{#1}%
1002 \HyPsd@AppendItalcorr\HyPsd@String
1003 \Hy@ReturnAfterFi{%
1004 \ifx\Hy@temp@A\empty
1005 \Hy@ReturnAfterElseFi{%
1006 \HyPsd@RemoveBraces{#2}%
1007 }%
1008 \else
1009 \Hy@ReturnAfterFi{%
1010 \HyPsd@ProtectSpaces\Hy@temp@A
1011 \HyPsd@AppendItalcorr\Hy@temp@A
1012 \expandafter\HyPsd@RemoveBraces\expandafter
1013 {\Hy@temp@A#2}%
1014 }%
1015 \fi
1016 }%
1017 \fi
1018 }

```

\HyPsd@AppendItalcorr \HyPsd@AppendItalcorr The string can contain commands yet, so it is better to use `\def` instead of a shorter `\edef`. The two help macros limit the count of `\expandafter`.

```

1019 \def\HyPsd@AppendItalcorr#1{%
1020 \expandafter\HyPsd@@AppendItalcorr\expandafter{\}\#1%
1021 }
1022 \def\HyPsd@@AppendItalcorr#1#2{%
1023 \expandafter\def\expandafter#2\expandafter{#2#1}%
1024 }

```

#### 6.6.4 Catcode check

Check catcodes.

\HyPsd@CheckCatcodes Because \ifcat expands its arguments, this is prevented by \noexpand. In case of command tokens and active characters \ifcat now sees a \relax. After protecting spaces and removing braces #1 should be a single token, no group of several tokens, nor an empty group. (So the \expandafter\relax between \ifcat and \noexpand is only for safety and it should be possible to remove it.)

\protect and \relax should be removed silently. But it is too dangerous and breaks some code giving them the meaning of \empty. So commands with the meaning of \protect are removed here. (\protect should have the meaning of \typeset@protect that is equal to \relax).

```

1025 \def\HyPsd@CheckCatcodes#1#2\HyPsd@End{%
1026 \global\let\HyPsd@Rest\relax

1142 Token not allowed in a PDFDocEncoded string:%
1143 \MessageBreak #1\MessageBreak
1144 removed%
1145 }%
1146 }

```

\HyPsd@ReplaceSpaceWarning

```

1147 \def\HyPsd@ReplaceSpaceWarning#1{%
1148 \HyPsd@Warning{%
1149 Token not allowed in a PDFDocEncoded string:%
1150 \MessageBreak #1\MessageBreak
1151 replaced by space%
1152 }%
1153 }

```

### 6.6.5 Check for wrong glyphs

A wrong glyph is marked with \relax, the glyph name follows, delimited by >. \empty ends the string.

```

1154 \def\HyPsd@GlyphProcess#1\relax#2\empty{%
1155 \expandafter\def\expandafter\HyPsd@String\expandafter{%
1156 \HyPsd@String#1%
1157 }%
1158 \ifx\\#2\\%

```

```

1159 \else
1160 \Hy@ReturnAfterFi{%
1161 \HyPsd@GlyphProcessWarning#2\@empty
1162 }%
1163 \fi
1164 }
1165 \def\HyPsd@GlyphProcessWarning#1>#2\@empty{%
1166 \HyPsd@Warning{%
1167 Glyph not defined in %
1168 P\ifHy@unicode U\else D1\fi\space encoding, \MessageBreak
1169 removing '\@backslashchar#1'%
1170 }%
1171 \HyPsd@GlyphProcess#2\@empty
1172 }

```

### Spaces.

- \HyPsd@spaceopti In the string the spaces are represented by \HyPsd@spaceopti tokens. Within an \edef it prints itself as a simple space and looks for its next argument. If another space follows, so it replaces the next \HyPsd@spaceopti by an protected space \040.

```

1173 \def\HyPsd@spaceopti#1{ % first space
1174 \ifx\HyPsd@spaceopti#1%
1175 \040%
1176 \else
1177 #1%
1178 \fi
1179 }%

```

### 6.6.6 Replacing tokens

- \HyPsd@Subst To save tokens \HyPsd@StringSubst is an wrapper for the command \HyPsd@Subst that does all the work: In string stored in command #3 it replaces the tokens #1 with #2.
- #1 Exact the tokens that should be replaced.
  - #2 The replacement (don't need to be expanded).
  - #3 Command with the string.

```

1180 \def\HyPsd@Subst#1#2#3{%
1181 \def\HyPsd@@Replace##1#1##2\END{%
1182 ##1%
1183 \ifx\\##2\\%
1184 \else
1185 ##2%
1186 \Hy@ReturnAfterFi{%
1187 \HyPsd@@Replace##2\END
1188 }%
1189 \fi
1190 }%
1191 \xdef#3{%
1192 \expandafter\HyPsd@@Replace#3#1\END
1193 }%
1194 }

```

- \HyPsd@StringSubst To save tokens in \pdfstringdef \HyPsd@StringSubst is a wrapper, that expands argument #1 before calling \HyPsd@Subst.

```

1195 \def\HyPsd@StringSubst#1{%
1196 \expandafter\HyPsd@Subst\expandafter{\string#1}%
1197 }

```

### 6.6.7 Support for package xspace

\HyPsd@doxspace does not work, because it uses a \futurelet that cannot be executed in TeX's mouth. So this implementation uses an argument to examine the next token. In a previous version I reused \@xspace, but this version is shorter and easier to understand.

```
1198 \def\HyPsd@doxspace#1{%
1199 \ifx#1\relax\else
1200 \ifx#1.\else
1201 \ifx#1:\else
1202 \ifx#1,\else

1278 }

```

### 6.6.9 Support for UTF-8 input encoding

After `\usepackage[utf8]{inputenc}` there are macros that expect the UTF-8 octets as arguments. Therefore we can calculate the PDF octal sequences directly. Because the PDF format is limited to UCS-2, conversion macros are needed for UTF-8 sequences with two and three octets only.

This calculation must be done in an expandable context, so we use eTeXhere for performance reasons. Unhappily the results of divisions are rounded. Thus a circumvention via `\di` `mexpr` is used, e.g.:

```
\numexpr 123/4\relax is replaced by
\number\di mexpr. 25\di mexpr 123sp\relax\relax\relax

1279 \begingroup\expandafter\expandafter\expandafter\endgroup
1280 \expandafter\ifx\csname numexpr\endcsname\relax
1281 \let\HyPsd@UTFviii\relax
1282 \else
1283 \def\HyPsd@UTFviii{%
1284 \let\UTFviii@two@octets\HyPsd@UTFviii@two
1285 \let\UTFviii@three@octets\HyPsd@UTFviii@three
1286 \let\unichar\HyPsd@unichar
1287 }%
```

The two octet form of UTF-8 110aaabb (A) and 10cccd (B) must be converted into octal numbers 00a and bcd. The result is `\8a\bcd` (with a, b, c, d as octal numbers). The conversion equations.

$$\begin{aligned} a &:= A/4 - 48 & (1) \\ b &:= A - 4 * (A/4) & (2) \\ c &:= B/8 - 8 * ((8 * (B/8))/8) & (3) \\ d &:= B - 8 * (B/8) & (4) \\ && (5) \end{aligned}$$

```

## 8 Help macros for links

Anchors get created on the baseline of where they occur. If an XYZ PDF view is set, this means that the link places the top of the screen *on the baseline* of the target. If this is an equation, for instance, it means that you cannot see anything. Some links, of course, are created at the start of environments, and so it works. To allow for this, anchors are raised, where possible, by some small amount. This defaults to \baseli nkskip, but users can set it to something else in two ways (thanks to Heiko Oberdiek for suggesting this):

1. Redefine \HyperRai seLi nkDefault to be eg the height of a \strut
2. Redefine \HyperRai seLi nkHook to do something complicated; it must give a value to \HyperRai seLi nkLength, which is what actually gets used

```

1420 \let\HyperRaiseLinkLength\@tempdima

1566 }

```

If we are going to PDF via HyperTeX \special commands, the dvips (-z option) processor does not know the *height* of a link, as it works solely on the position of the closing \special. If we use this option, the \special is raised up by the right amount, to fool the dvi processor.

```

1567 \define@key{Hyp}{raiselinks}[true]{%
1568 \Hy@boolkey{raiselinks}{#1}%
1569 }

Most PDF-creating drivers do not allow links to be broken
1570 \define@key{Hyp}{breaklinks}[true]{%
1571 \Hy@boolkey{breaklinks}{#1}%
1572 }

Determines whether an automatic anchor is put on each page
1573 \define@key{Hyp}{pageanchor}[true]{%
1574 \Hy@boolkey{pageanchor}{#1}%
1575 }

Are the page links done as plain arabic numbers, or do they follow the formatting of the
package? The latter loses if you put in typesetting like \textbf or the like.
1576 \define@key{Hyp}{plainpages}[true]{%
1577 \Hy@boolkey{plainpages}{#1}%
1578 }

Are the names for anchors made as per the HyperTeX system, or do they simply use what
LATEX provides?
1579 \define@key{Hyp}{naturalnames}[true]{%
1580 \Hy@boolkey{naturalnames}{#1}%
1581 }

Completely ignore the names as per the HyperTeX system, and use unique counters.
1582 \define@key{Hyp}{hypertexnames}[true]{%
1583 \Hy@boolkey{hypertexnames}{#1}%
1584 }

Currently, dvi ps doesn't allow anchors nested within targets, so this option tries to stop
that happening. Other processors may be able to cope.
1585 \define@key{Hyp}{nesting}[true]{%

1971 }

```

The depth of the outlines is controlled by option bookmarksdepth. The option acts globally and distinguishes three cases:

- **bookmarksdepth**: Without value hyperref uses counter tocdepth (compatible behaviour and default).

- `bookmarksdepth=<number>`: the depth is set to `<number>`.
- `bookmarksdepth=<name>`: The `<name>` must not start with a number or minus sign. It is a document division name (part, chapter, section, ...). Internally the value of macro `\toclevel@<name>` is used.

```

2047 }

```

The value of the bordercolor options are not processed by the color package. Therefore the value consists of space separated rgb numbers in the range 0 until 1.

Package xcolor provides \XC@bordercolor since version 1.1. If the two spaces in the color specification are missing, then the value is processed as color specification from package xcolor or by using \XC@bordercolor (since xcolor 2004/05/09 v1.11).

## 16 User hypertext macros

We need to normalise all user commands taking a URL argument; Within the argument the following special definitions apply: \#, \%, ~ produce #, %, ~ respectively. for consistency \~ produces ~ as well. At the *top level only* ie not within the argument of another command, you can use # and % unescaped, to produce themselves. even if, say, # is entered as # it will be converted to \# so it does not die if written to an aux file etc. \# will write as # locally while making \special s.

2594 }

```

`\hyperref` is more complicated, as it includes the concept of a category of link, used to make the name. This is not really used in this package. `\hyperdef` sets up an anchor in the same way. They each have three parameters of category, linkname, and marked text, and `\hyperref` also has a first parameter of URL. If there is an optional first parameter to `\hyperdef`, it is the name of a L<sup>A</sup>T<sub>E</sub>X label which can be used in a short form of `\hyperref` later, to avoid remembering the name and category.

## 17 Underlying basic hypertext macros

Links have an optional type, a filename (possibly a URL), an internal name, and some marked text. (Caution: the internal name may contain babel shorthand characters.) If the second parameter is empty, its an internal link, otherwise we need to open another file or a URL. A link start has a type, and a URL.

```

2652 \def\hyper@@link{\let\Hy@reserved@a\relax
2653 \c@ifnextchar[\{\hyper@link@]{\hyper@link@[link]}%
2654 }%
2655 \def\hyper@link@[#1]#2#3#4{%
2656 \begingroup
2657 \protected@edef\Hy@tempa{#2}%
2658 \Hy@safe@activestore
2659 \edef\x{#3}%
2660 \ifx\Hy@tempa\empty
2661 \toks0{\hyper@link{#1}}%
2662 \else
2663 \toks0{\expandafter\hyper@readexternallink#2\\{#1}}%
2664 \fi
2665 \toks1{{#4}}%
2666 \edef\x{\endgroup
2667 \the\toks0 \x \the\toks1 %
2668 }%
2669 \x

```

```
2670 }
```

The problem here is that the first (URL) parameter may be a local file: reference (in which case some browsers treat it differently) or a genuine URL, in which case we'll have to activate a real Web browser. Note that a simple name is also a URL, as that is interpreted as a relative file name. We have to worry about # signs in a local file as well.

```
2671 \def\hyper@readexternallink#1\#2#3#4{%
```

Parameters are:

1. The URL or file name
2. The type
3. The internal name
4. The link string

We need to get the 1st parameter properly expanded, so we delimit the arguments rather than passing it inside a group.

```
2672 \expandafter\@hyper@readexternallink{\#2}{\#3}{\#4}{\#1}:\:\{\#1\}%
2673 }
```

Now (potentially), we are passed: 1) The link type 2) The internal name, 3) the link string, 4) the URL type (http, mailto, file etc), 5) the URL details 6) anything after a real : in the URL 7) the whole URL again

```
2674 \def\@pdftempwordfile{file}%
2675 \def\@pdftempwordrun{run}%
2676 \def\@hyper@readexternallink#1#2#3#4:#5:#6\#7{%
```

If there are no colons at all (#6 is blank), its a local file; if the URL type (#4) is blank, its probably a Mac filename, so treat it like a file: URL. The only flaw is if its a relative Mac path, with several colon-separated elements — then we lose. Such names must be prefixed with an explicit dvi :

```
2677 \ifx\#6\%
2678 \expandafter\@hyper@linkfile file:#7\{\#3\}{\#2}%
2679 \else
2680 \ifx\#4\%
2681 \expandafter\@hyper@linkfile file:#7\{\#3\}{\#2}%
2682 \else
```

If the URL type is ‘file’, pass it for local opening

```
2683 \def\@pdftempa{\#4}%
2684 \ifx\@pdftempa\@pdftempwordfile
2685 \expandafter\@hyper@linkfile#7\{\#3\}{\#2}%
2686 \else
```

if it starts ‘run:’, its to launch an application.

```
2687 \ifx\@pdftempa\@pdftempwordrun
2688 \expandafter\@hyper@launch#7\{\#3\}{\#2}%
2689 \else
```

otherwise its a URL

```
2690 \hyper@linkurl{\#3}{\#7\ifx\#2\\else\hyper@hash\#2\fi}%
2691 \fi
2692 \fi
2693 \fi
2694 \fi
2695 }
```

By default, turn run: into file:

```
2696 \def\@hyper@launch run:#1\\#2#3{%
2697 \hyper@linkurl{#2}{\Hy@linkfileprefix#1\ifx\\#3\\else\hyper@hash#3\fi}%
2698 }
```

D P Story [jstory@uakron.edu](mailto:jstory@uakron.edu) pointed out that relative paths starting .. fell over. Switched to using \filename@parse to solve this.

```
2699 \def\@hyper@linkfile file:#1\\#2#3{%
2700 %file url,link string, name
2701 \filename@parse{#1}%
2702 \ifx\filename@ext\relax
2703 \edef\filename@ext{\XR@ext}%
2704 \fi
2705 \def\use@file{\filename@area\filename@base.\filename@ext}%
2706 \ifx\filename@ext\XR@ext
2707 \hyper@linkfile{#2}{\use@file}{#3}%
2708 \else
2709 \ifx@\baseurl\@empty
2710 \hyper@linkurl{#2}{%
2711 \Hy@linkfileprefix\use@file\ifx\\#3\\else\hyper@hash#3\fi
2712 }%
2713 \else
2714 \hyper@linkurl{#2}{\use@file\ifx\\#3\\else\hyper@hash#3\fi}%
2715 \fi
2716 \fi
2717 }
```

Anchors have a name, and marked text. We have to be careful with the marked text, as if we break off part of something to put a \special around it, all hell breaks loose. Therefore, we check the category code of the first token, and only proceed if its safe. Tanmoy sorted this out.

A curious case arises if the original parameter was in braces. That means that #2 comes here a multiple letters, and the noexpand just looks at the first one, putting the rest in the output. Yuck.

```

2750 }

```

## 18 Compatibility with the *L<sup>A</sup>T<sub>E</sub>X2html* package

Map our macro names on to Nikos', so that documents prepared for that system will work without change.

Note, however, that the whole complicated structure for segmenting documents is not supported; it is assumed that the user will load `html.sty` first, and then `hyperref.sty`, so that the definitions in `html.sty` take effect, and are then overridden in a few circumstances by this package.

```

2751 \let\htmladdimg\hyperimage
2752 \def\htmladdnormallink#1#2{\href{#2}{#1}}
2753 \def\htmladdnormallinkfoot#1#2{\href{#2}{#1}\footnote{#2}}
2754 \def\htmlref#1#2{%
 \anchor{#1}{#2}
 \label{#1}
 \label@hyperref{#2}{#1}%
}
2756 }

```

This is really too much. The *L<sup>A</sup>T<sub>E</sub>X2html* package defines its own `\hyperref` command, with a different syntax. Was this always here? Its weird, anyway. We interpret it in the ‘printed’ way, since we are about fidelity to the page.

```

2757 \def\@@latextohtmlX{%
2758 \let\hhyperref\hyperref

```

## 19 Forms creation

Allow for creation of PDF or HTML forms. The effects here are limited somewhat by the need to support both output formats, so it may not be as clever as something which only wants to make PDF forms.

I could not have started this without the encouragement of T V Raman.

3113 }

```

## 22 Localized nullifying of package

Sometimes we just don't want the wretched package interfering with us. Define an environment we can put in manually, or include in a style file, which stops the hypertext functions doing anything. This is used, for instance, in the Elsevier classes, to stop `hyperref` playing havoc in the front matter.

```

3114 \def\NoHyper{%
3115 \def\hyper@link@[##1]##2##3##4{##4}%
3116 \def\hyper@@anchor##1{}%
3117 \global\let\hyper@livelink\hyper@link

3138 }
3139 \def\endNoHyper{%
3140 \global\let\hyper@link\hyper@livelink
3141 }
3142
```

## 23 Package `nohyperref`

This package is introduced by Sebastian Rahtz.

Package `nohyperref` is a dummy package that defines some low level and some top-level commands. It is done for `jadetex`, which calls `hyperref` low-level commands, but it would also be useful with people using normal `hyperref`, who really do not want the package loaded at all.

Some low-level commands:

```
3143 <*nohyperref>
```

```

3144 \let\hyper@anchor@\gobble
3145 \def\hyper@link#1#2#3{#3}%
3146 \let\hyper@anchorstart@\gobble
3147 \let\hyper@anchorend@\empty
3148 \let\hyper@linkstart@\gobbletwo
3149 \let\hyper@linkend@\empty
3150 \def\hyper@linkurl#1#2{#1}%
3151 \def\hyper@linkfile#1#2#3{#1}%
3152 \let\PDF@SetupDoc\empty
3153 \let\PDF@FinishDoc\empty

```

Some top-level commands:

```

3154 \let\Acrobatmenu@\gobble
3155 \let\pdfstringdefDisableCommands@\gobbletwo
3156 \let\texorpdfstring@\firstoftwo
3157 \let\pdfbookmark@\undefined
3158 \newcommand\pdfbookmark[3][]{}
3159 \let\phantomsection@\empty
3160 \let\hypersetup@\gobble
3161 \let\hyperbaseurl@\gobble
3162 \let\href@\gobble
3163 \let\hyperdef@\gobbletwo
3164 \let\hyperlink@\gobble
3165 \let\hypertarget@\gobble
3166 \def\hyperref{\@ifnextchar[\@gobbleopt{\expandafter\gobbletwo\gobble}}
3167 \long\def\@gobbleopt[#1]{}
3168 \let\hyperpage@\empty
3169 </nohyperref>

```

## 24 The Mangling Of Aux and Toc Files

Some extra tests so that the hyperref package may be removed or added to a document without having to remove .aux and .toc files (this section is by David Carlisle) All the code is delayed to \begin{document}

```

3170 (*package)
3171 \AfterBeginDocument{%

```

First the code to deal with removing the hyperref package from a document.

Write some stuff into the aux file so if the next run is done without hyperref, then \contentsline and \newlabel are defined to cope with the extra arguments.

```

3172 \if@filesw
3173 \ifHy@typxml
3174 \immediate\closeout\mainaux
3175 \immediate\openout\mainaux\jobname.aux
3176 \immediate\write\auxout{<relaxxml>\relax}%
3177 \fi
3178 \immediate\write\auxout{%
3179 \string\ifx\string\hyper@anchor\string\@undefined^^J%
3180 \global\let\string\oldcontentsline\string\contentsline^^J%
3181 \gdef\string\contentsline{%
3182 \string#1\string#2\string#3\string#4{%
3183 \string\oldcontentsline{%
3184 \string#1\{\string#2\{\string#3\}}^^J%
3185 \global\let\string\oldnewlabel\string\newlabel^^J%
3186 \gdef\string\newlabel\string#1\string#2{%
3187 \string\newlabelxx{\string#1\string#2}^^J%

```

```

3188 \gdef\string\newlabelxx%
3189 \string#1\string#2\string#3\string#4\string#5\string#6{%
3190 \string\oldnewlabel{\string#1}{\string#2}{\string#3}}}}^^J%

```

But the new aux file will be read again at the end, with the normal definitions expected, so better put things back as they were.

```

3191 \string\AtEndDocument{%
3192 \let\string\contentsline\string\oldcontentsline^^J%
3193 \let\string\newlabel\string\oldnewlabel}^^J%

```

If the document is being run with hyperref put this definition into the aux file, so we can spot it on the next run.

```

3194 \string\else^^J%
3195 \global\let\string\hyper@last\relax^^J%
3196 \string\fi^^J%
3197 }%
3198 \fi

```

Now the code to deal with adding the hyperref package to a document with aux and toc written the standard way.

If hyperref was used last time, do nothing. If it was not used, or an old version of hyperref was used, don't use that TOC at all but generate a warning. Not ideal, but better than failing with pre-5.0 hyperref TOCs.

```

3199 \ifx\hyper@last\@undefined
3200 \def\@starttoc#1{%
3201 \begingroup
3202 \makeatletter
3203 \IfFileExists{\jobname.#1}{%
3204 \Hy@WarningNoLine{%
3205 old #1 file detected, not used; run LaTeX again%
3206 }%
3207 }{}%
3208 \if@filesw
3209 \expandafter\newwrite\csname tf@#1\endcsname
3210 \immediate\openout\csname tf@#1\endcsname \jobname.#1\relax
3211 \fi
3212 \nobreakfalse
3213 \endgroup
3214 }%
3215 \def\newlabel#1#2{\@newlabel{#1}{#2}{}}%
3216 \fi
3217 }

```

## 25 Title strings

If options pdftitle and pdfauthor are not used, these informations for the pdf information dictionary can be extracted by the nd

```

3218 \ifHy@usetitle
3219 \let\HyOrg@title\title
3220 \let\HyOrg@author\author
3221 \def\title{\@ifnextchar[\{\Hy@scantitle\}\{\Hy@scantitle\}}%
3222 \def\Hy@scantitle[#1]{%
3223 \gdef\Hy@title[#1]%
3224 \HyOrg@title[#1]%
3225 }%
3226 \def\Hy@scantitle#1{%

```

```

3227 \gdef\Hy@title{#1}%
3228 \HyOrg@title{#1}%
3229 }
3230 \def\author{\@ifnextchar[{\Hy@scanoptauthor}{\Hy@scanauthor}}%
3231 \def\Hy@scanauthor[#1]{%
3232 \gdef\Hy@author{#1}%
3233 \HyOrg@author[{#1}]%
3234 }%
3235 \def\Hy@scanauthor#1{%
3236 \gdef\Hy@author{#1}%
3237 \HyOrg@author{#1}%
3238 }

```

The case, that or re given before hyperref is loaded, is much more complicate, because LaTeX initializes the macros title and author with LaTeX error and warning messages.

```

3239 \begingroup
3240 \def\process@me#1\@nil#2{%
3241 \expandafter\let\expandafter\x\csname @#2\endcsname
3242 \edef\y{\expandafter\strip@prefix\meaning\x}%
3243 \def\c##1#1##2\@nil{%
3244 \ifx\##1\%
3245 \else
3246 \expandafter\gdef\csname Hy@#2\expandafter\endcsname
3247 \expandafter{\x}%
3248 \fi
3249 }%
3250 \expandafter\c\y\relax#1\@nil
3251 }%
3252 \expandafter\process@me\string\@latex@{\@nil{title}}%
3253 \expandafter\process@me\string\@latex@{\@nil{author}}%
3254 \endgroup
3255 \fi
3256 \Hy@DisableOption{pdfusetitle}

```

Macro \Hy@UseMaketitleinfos is used in the driver files, before the information entries are used.

The newline macro \newline or \\ is much more complicate. In the title a good replacement can be a space, but can be already a space after \\ in the title string. So this space is removed by scanning for the next non-empty argument.

In the macro \author the newline can perhaps separate the different authors, so the newline expands here to a comma with space.

The possible arguments such as space or the optional argument after the newline macros are not detected.

```

3257 \def\Hy@UseMaketitleString#1{%
3258 \@ifundefined{Hy@#1}{}{%
3259 \begingroup
3260 \let\Hy@saved@hook\pdfstringdefPreHook

3277 \Hy@UseMaketitleString{title}%
3278 \Hy@UseMaketitleString{author}%
3279 }

```

## 26 Page numbers

This stuff is done by Heiko Oberdiek.

### 26.1 PDF /PageLabels

Internal macros of this module are marked with \HyPL@.

```
3280 \ifHy@pagelabels
```

**\thispdfpagelabel** The command \thi spdfpagelabel allows to label a special page without the redefinition of \thepage for the page.

```

3281 \def\thispdfpagelabel#1{%
3282 \gdef\HyPL@thisLabel{#1}%
3283 }
3284 \global\let\HyPL@thisLabel\relax

```

**\HyPL@Labels** The page labels are collected in \HyPL@Label s and set at the end of the document.

```
3285 \def\HyPL@Labels{}
```

**\Hy@abspage** We have to know the the absolute page number and introduce a new counter for that.

```

3286 \newcount\Hy@abspage
3287 \Hy@abspage=0

```

For comparisons with the values of the previous page, some variables are needed:

```

3288 \def\HyPL@LastType{init}%
3289 \def\HyPL@LastNumber{0}%
3290 \def\HyPL@LastPrefix{}%

```

Definitions for the PDF names of the L<sup>A</sup>T<sub>E</sub>X pendants.

```

3291 \def\HyPL@arabic{D}%
3292 \def\HyPL@Roman{R}%
3293 \def\HyPL@roman{r}%
3294 \def\HyPL@Alph{A}%
3295 \def\HyPL@alph{a}%

```

**\HyPL@EveryPage** If a page is shipout and the page number is known, \HyPL@EveryPage has to be called. It stores the current page label.

```

3296 \def\HyPL@EveryPage{%
3297 \begingroup

### 26.1.1 pdfTeX and VTeX

Because of pdfTeX’s \pdfcatalog command the /PageLabels entry can set at end of document in the first run.

|                |                                                                                                                                                                                                                                                                              |
|----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| \Hy@PutCatalog | 3422 <pdftex>\let\Hy@PutCatalog\pdfcatalog                                                                                                                                                                                                                                   |
|                | The code for VTeX is more complicate, because it does not allow the direct access to the /Catalog object. The command scans its argument and looks for a /PageLabels entry.                                                                                                  |
|                | VTeX 6.59g is the first version, that implements \speci al {! pdffagelabels...}. For this version \VTeXversion reports 660.                                                                                                                                                  |

## 27 Automated L<sup>A</sup>T<sub>E</sub>X hypertext cross-references

Anything which can be referenced advances some counter; we overload this to put in a hypertext starting point (with no visible anchor), and make a note of that for later use in `\label`. This will fail badly if `\theH<name>` does not expand to a sensible reference. This means that classes or package which introduce new elements need to define an equivalent `\theH<name>` for every `\the<name>`. We do make a trap to make `\theH<name>` be the same as `\arabic{<name>}`, if `\theH<name>` is not defined, but this is not necessarily a good idea. Alternatively, the ‘naturalnames’ option uses whatever L<sup>A</sup>T<sub>E</sub>X provides, which may be useable. But then its up to you to make sure these are legal PDF and HTML names. The ‘hypertexnames=false’ option just makes up arbitrary names.

All the shenanigans is to make sure section numbers etc are always arabic, separated by dots. Who knows how people will set up `\@currentlabel`? If they put spaces in, or brackets (quite legal) then the hypertext processors will get upset.

But this is flaky, and open to abuse. Styles like `subeqn` will mess it up, for starters. Appendices are an issue, too. We just hope to cover most situations. We can at least cope with the standard sectioning structure, allowing for `\part` and `\chapter`.

Start with a fallback for equations

```

3508 \newcommand{\theHequation}{\theHsection.\arabic{equation}}
3509 @ifundefined{theHpart}{}{\newcommand{\theHpart}{\arabic{part}}}
3510 @ifundefined{theHchapter}{}%

```

Tanmoy asked for this default handling of undefined \theH<name> situations. It really isn't clear what would be ideal, whether to turn off hyperizing of unknown elements, to pick up the textual definition of the counter, or to default it to something like \arabic{name}. We take the latter course, slightly worriedly.

```

3541 \let\H@refstepcounter\refstepcounter

## 28 Package lastpage support

Package lastpage directly writes the `\newlabel` command to the aux file. Because package hyperref requires additional arguments, the internal command `\lastpage@putlabel` is redefined. The patch is deferred by `\AtBeginDocument`, because it is possible that package lastpage is loaded after package hyperref. The same algorithm (options hypertexnames and plainpages) is used to get the page anchor name as in `\@hyperfi xhead` (see sec. 37). The link will not work if option pageanchor is set to false.

```

\lastpage@putlabel

3671 <*package>

```

## 29 Package ifthen support

Since version 6.75a this is done in package nameref.

For compatibility \hypergetref and \hypergetpageref are still provided. But they do not generate warnings, if the reference is undefined.

```

3672 \def\hypergetref#1{\getrefbykeydefault{#1}{}{??}}
3673 \def\hypergetpageref#1{\getrefbykeydefault{#1}{page}{0}}

```

## 30 Package titlesec and titletoc support

This code is contributed by Javier Bezos (Email: j bezos@arraki.s.es).

Package titlesec support:

```

3674 \@ifpackageloaded{titlesec}{%
3675 \def\ttl@Hy@steplink#1{%
3676 \Hy@GlobalStepCount\Hy@linkcounter
3677 \xdef\@currentHref{#1*\.\the\Hy@linkcounter}%
3678 \def\ttl@Hy@saveanchor{%
3679 \Hy@raisedlink{\hyper@anchorstart{\@currentHref}\hyper@anchorend}%
3680 }%
3681 }%
3682 \def\ttl@Hy@refstepcounter#1{%

```

```

3683 \let\ttl@b\Hy@raisedlink
3684 \def\Hy@raisedlink##1{\def\ttl@Hy@saveanchor{\Hy@raisedlink{##1}}}\%
3685 \refstepcounter{#1}%
3686 \let\Hy@raisedlink\ttl@b
3687 }%
3688 }{}}

 Package titletoc support:

3689 \@ifpackageloaded{titletoc}{%
3690 \def\ttl@gobblecontents#1#2#3#4{\ignorespaces}%
3691 }{}}

```

## 31 Package varioref support

Package nameref uses five arguments for the ref system. Fix provided by Felix Neubauer (felix.neubauer@gmx.net).

```

3692 \def\Hy@varioref@undefined{{?}{?}{?}{?}{?}}%
3693 \@ifpackageloaded{varioref}{%
3694 \def\vref@pagenum#1#2{%
3695 \ifundefined{r@#2}{%
3696 \expandafter\let\csname r@#2\endcsname\Hy@varioref@undefined
3697 }{%
3698 \edef#1{\getpagerefnumber{#2}}%
3699 }%
3700 }{}}

```

## 32 Package longtable support

Sometimes the anchor of the longtable goes to the previous page. Thus the following patch separates the anchor setting and counter incrementation by hyperref's \refstepcounter and the anchor setting is moved after \vskip p\LTpre.

Patch of \LT@array: replace \refstepcounter by the original \H@refstepcounter without anchor generation

```

3701 \@ifpackageloaded{longtable}{%
3702 \begingroup
3703 \def\y{\LT@array}%
3704 \ifundefined{scr@LT@array}{}{\def\y{\scr@LT@array}}%
3705 \long\def\x\refstepcounter#1#2@sharp#3#4@nil{%
3706 \expandafter\endgroup
3707 \expandafter\def\y[##1]##2{%
3708 \H@refstepcounter{#1}%
3709 \hyper@makecurrent{table}%
3710 #2@sharp####4%
3711 }%
3712 }%
3713 \expandafter\expandafter\expandafter\x\y[#1]{#2}@nil

```

Patch of \LT@Start: add anchor before first line after \vskip p\LTpre

```

3714 \begingroup
3715 \def\x#1\ifvoid\LT@firsthead\copy#2@nil{%
3716 \endgroup
3717 \def\LT@start{%
3718 #1%
3719 \hyper@refstepcounter{table}%
3720 \ifvoid\LT@firsthead\copy

```

```

3721 #2%
3722 }%
3723 }%
3724 \expandafter\x\LT@start\@nil
3725 }{}
```

## 33 Equations

We want to make the whole equation a target anchor. Overload equation, temporarily reverting to original `\refstepcounter`. If, however, it is in AMS math, we do not do anything, as the tag mechanism is used there (see section 40). The exception is that we move the equation incrementation inside the math environment to avoid specials outside and a wrong vertical spacing of equation environments.

```

3726 \let\new@refstepcounter\refstepcounter
3727 \let\H@equation\equation
3728 \let\H@endequation\endequation
3729 \@ifpackageloaded{amsmath}{%
3730 \long\def\Hy@temp{%
3731 \incr@eqnum
3732 \mathdisplay@push
3733 \st@rredfalse \global\@eqnswtrue
3734 \mathdisplay{equation}%
3735 }%
3736 \ifx\Hy@temp\equation
3737 \expandafter\ifx\csname if@fleqn\expandafter\endcsname
3738 \csname iftrue\endcsname
3739 \else
3740 \long\def\equation{%
3741 \mathdisplay@push
3742 \st@rredfalse \global\@eqnswtrue
3743 \mathdisplay{equation}%
3744 \incr@eqnum
3745 }%
3746 \fi
3747 \fi
3748 }{%
3749 \def\equation{%
3750 \let\refstepcounter\H@refstepcounter
3751 \H@equation
3752 \make@stripped@name{\theequation}%
3753 \let\theHequation\newname
3754 \hyper@makecurrent{equation}%
3755 \Hy@raisedlink{\hyper@anchorstart{\@currentHref}}%
3756 \let\refstepcounter\new@refstepcounter
3757 }%
3758 \def\endequation{\Hy@raisedlink{\hyper@anchorend}\H@endequation}%
3759 }
```

My goodness, why can't L<sup>A</sup>T<sub>E</sub>X be consistent? Why is `\eqnarray` set up differently from other objects?

People (you know who you are, Thomas Beuth) sometimes make an `\eqnarray` where *all* the lines end with `\notag`, so there is no suitable anchor at all. In this case, pass by on the other side.

```

3760 \newif\if@eqnstar
3761 \oeqnstarfalse
```

```

3762 \let\H@eqnarray\eqnarray
3763 \let\H@endeqnarray\endeqnarray
3764 \def\eqnarray{%
3765 \let\Hy@reserved@a\relax
3766 \def\@currentHref{}%
3767 \H@eqnarray
3768 \if@eqnstar
3769 \else
3770 \ifx\\@\currentHref\\%
3771 \else
3772 \make@stripped@name{\theequation}%
3773 \let\theEquation\newname
3774 \hyper@makecurrent{equation}%
3775 \hyper@anchorstart{\@currentHref}{}\hyper@anchorend
3776 \fi
3777 \fi
3778 }
3779 \def\endeqnarray{%
3780 \H@endeqnarray
3781 }

```

This is quite heavy-handed, but it works for now. If its an eqnarray\* we need to disable the hyperref actions. There may well be a cleaner way to trap this. Bill Moss found this.

```

3782 \cnamedef{eqnarray*}{%
3783 \def\@eqncr{\nonumber\@seqncr}\@eqnstartrue\eqnarray
3784 }
3785 \cnamedef{endeqnarray*}{%
3786 \nonumber\endeqnarray\@eqnstarfalse
3787 }

```

Then again, we have the *subeqnarray* package. Tanmoy provided some code for this:

```

3788 \cifundefined{subeqnarray}{}{%
3789 \let\H@subeqnarray\subeqnarray
3790 \let\H@endsubeqnarray\endsubeqnarray
3791 \def\subeqnarray{%
3792 \let\Hy@reserved@a\relax
3793 \H@subeqnarray
3794 \make@stripped@name{\theequation}%
3795 \let\theEquation\newname
3796 \hyper@makecurrent{equation}%
3797 \hyper@anchorstart{\@currentHref}{}\hyper@anchorend
3798 }%
3799 \def\endsubeqnarray{%
3800 \H@endsubeqnarray
3801 }%
3802 \newcommand\theHsubequation{\theEquation\alph{subequation}}%
3803 }

```

The aim of this macro is to produce a sanitized version of its argument, to make it a safe label.

```

3804 \def\make@stripped@name#1{%
3805 \begingroup
3806 \escapechar\m@ne
3807 \global\let\newname\empty
3808 \protected@edef\Hy@tempa{#1}%
3809 \edef\@tempb{%
3810 \noexpand\@tfor\noexpand\Hy@tempa:=%
3811 \expandafter\strip@prefix\meaning\Hy@tempa
3812 }%

```

```

3813 \@tempb\do{%
3814 \if{\Hy@tempa\else
3815 \if}\Hy@tempa\else
3816 \xdef\newname{\newname\Hy@tempa}%
3817 \fi
3818 \fi
3819 }%
3820 \endgroup
3821 }

```

## 34 Footnotes

The footnote mark is a hypertext link, and the text is a target. We separately number the footnotes sequentially through the text, separately from whatever labels the text assigns. Too hard to keep track of markers otherwise. If the raw forms \footnotemark and \footnotetext are used, force them to use un-hyper original.

Tabularx causes footnote problems, disable the linking if that is loaded.

```

Redefine `\@footnotemark`, borrowing its code (at the cost of getting out of sync with `latex.ltx`), to take advantage of its white space and hyphenation fudges. If we just overload it, we can get variant documents (the word before the footnote is treated differently). Thanks to David Carlisle and Brian Ripley for confusing and helping me on this.

```

## 36 Bibliographic references

This is not very robust, since many styles redefine these things. The package used to redefine \@ci{tex} and the like; then we tried adding the hyperref call explicitly into the .aux file. Now we redefine \bi{bci}{te}; this still breaks some citation packages so we have to work around them. But this remains extremely dangerous. Any or all of *achemso*, *chapterbib*, and *drftcite* may break.

However, lets make an attempt to get *natbib* right, because thats a powerful, important package. Patrick Daly (dal y@l i nmpi . mpg. de) has provided hooks for us, so all we need to do is activate them.

```

4075 \def\hyper@natlinkstart#1{%

### 36.1 Package harvard

Override Peter Williams' Harvard package; we have to a) make each of the citation types into a link; b) make each citation write a backref entry, and c) kick off a backreference section for each bibliography entry.

The redefinitions have to be deferred to `\begin{document}`, because if `harvard.sty` is loaded and `html.sty` is present and detects `pdfTeX`, then `hyperref` is already loaded at the begin of `harvard.sty`, and the `\newcommand` macros causes error messages.

```

4226 \@ifpackageloaded{harvard}{%

## 39 New counters

The whole theorem business makes up new counters on the fly; we are going to intercept this. Sigh. Do it at the level where new counters are defined.

```
4486 \let\H@definecounter\@definecounter
4487 \def\@definecounter#1{%
4488 \H@definecounter{#1}%
4489 \expandafter\def\csname theH#1\endcsname{\arabic{#1}}%
4490 }
```

But what if they have used the optional argument to e.g. `\newtheorem` to determine when the numbering is reset? OK, we'll trap that too.

```
4491 \let\H@newctr\@newctr
4492 \def\@newctr#1[#2]{%
4493 \H@newctr#1[{\#2}]%
4494 \expandafter\def\csname theH#1\endcsname{%
4495 \csname the\@ifundefined{theH#2}{\H@#2\endcsname.\arabic{#1}}%
4496 }%
4497 }
```

## 40 AMSL<sup>A</sup>T<sub>E</sub>X compatibility

Oh, no, they don't use anything as simple as `\refstepcounter` in the AMS! We need to intercept some low-level operations of theirs. Damned if we are going to try and work out what they get up to. Just stick a label of 'AMS' on the front, and use the label *they* worked out. If that produces something invalid, I give up. They'll change all the code again anyway, I expect.

```
4498 \let\Hmake@df@tag@@\make@df@tag@@
4499 \def\make@df@tag@@#1{%
4500 \Hmake@df@tag@@{#1}%
4501 \Hy@GlobalStepCount\Hy@linkcounter
4502 \xdef\@currentHref{AMS.\the\Hy@linkcounter}%
4503 \Hy@raisedlink{\hyper@anchorstart{\@currentHref}\hyper@anchorend}%
4504 }
4505 \let\Hmake@df@tag@@@\make@df@tag@@@
4506 \def\make@df@tag@@@#1{%
4507 \Hmake@df@tag@@@{#1}%
4508 \Hy@GlobalStepCount\Hy@linkcounter
4509 \xdef\@currentHref{AMS.\the\Hy@linkcounter}%
4510 \Hy@raisedlink{\hyper@anchorstart{\@currentHref}\hyper@anchorend}%
4511 }
```

Only play with `\seteqqlabel` if we are using pdftex. Other drivers cause problems; requested by Michael Downes (AMS).

```
4512 \ifpackagewith{hyperref}{pdftex}{%
4513 \let\H@seteqqlabel\seteqqlabel
4514 \def\@seteqqlabel#1{%

4517 \Hy@raisedlink{\hyper@anchorstart{\@currentHref}\hyper@anchorend}%
4518 }%
4519 }
```

This code I simply cannot remember what I was trying to achieve. The final result seems to do nothing anyway.

```
\let\H@tagform@\tagform@
```

```

\def\tagform@#1{%
 \maketag@@@{\hyper@@anchor{\@currentHref}%
 {(\ignorespaces#1\unskip)}}}%
}
\def\eqref#1{\textup{\H@tagform@{\ref{#1}}}}

```

## 40.1 \@addtoreset and \numberwithin patches

\@addtoreset puts a counter to the reset list of another counter. After a reset the counter starts again with perhaps already used values. Therefore the hyperref version of the counter print command \theHcounter is redefined in order to add the parent counter.

```

4520 \let\HyOrg@addtoreset\@addtoreset
4521 \def\@addtoreset#1#2{%
4522 \HyOrg@addtoreset{#1}{#2}%
4523 \expandafter\xdef\csname theH#1\endcsname{%

4573 }
4574 \fi
4575 \Hy@DisableOption{hyperfigures}

```

## 42 hyperindex entries

Internal command names are prefixed with `\HyInd@`.

Hyper-indexing works crudely, by forcing code onto the end of the index entry with the `|` feature; this puts a hyperlink around the printed page numbers. It will not proceed if the author has already used the `|` specifier for something like emboldening entries. That would make Makeindex fail (cannot have two `|` specifiers). The solution is for the author to use generic coding, and put in the requisite `\hyperpage` in his/her own macros along with the boldness.

This section is poor stuff; it's open to all sorts of abuse. Sensible large projects will design their own indexing macros any bypass this.

```

This breaks TeX4ht, so leave it to last. Emend `\@setref` to put out a hypertext link as well as its normal text (which is used as an anchor). (`\endinput` have to be on the same line like `\fi`, or you have to use `\expandafter` before.)

```

4862 \ifHy@texht
4863 \expandafter\endinput
4864 \fi
4865 \let\real@setref\@setref
4866 \def\@setref#1#2#3{%

## 45 Configuration files

### 45.1 PS/PDF strings

Some drivers write PS or PDF strings. These strings are delimited by parentheses, therefore a lonely unmatched parenthesis must be avoided to avoid PS or PDF syntax errors. Also the backslash character itself has to be protected.

\Hy@pstringdef Therefore such strings should be passed through \Hy@pstringdef. The first argument holds a macro for the result, the second argument is the string that needs protecting. Since version 1.30.0 pdfTeX offers \pdfescapestring.

```

## 45.2 pdftex

```
5047 <*pdftex>
```

This driver is for Han The Thanh's TeX variant which produces PDF directly. This has new primitives to do PDF things, which usually translate almost directly to PDF code, so there is a lot of flexibility which we do not at present harness.

First, allow for some changes and additions to pdftex syntax:

```

5048 \def\setpdflinkmargin#1{\pdflinkmargin#1}
5049 \ifx\pdfstartlink\undefined% less than version 14
5050 \let\pdfstartlink\pdfannotlink
5051 \let\pdflinkmargin\tempdima
5052 \let\pdfxform\pdfform
5053 \let\pdflastxform\pdflastform
5054 \let\pdfrefxform\pdfrefform
5055 \else
5056 \pdflinkmargin1pt
5057 \fi

```

First set up the default linking

```
5058 \providecommand\pdfview{XYZ}
```

First define the anchors:

```

5059 \def\newpdflink#1{%
5060 \ifHy@verbose
5061 \typeout{pdftex: define anchor at line \the\inputlineno: #1}%
5062 \fi
5063 \Hy@SaveLastskip
5064 \Hy@pstringdef\Hy@pstringDest{#1}%
5065 \Hy@DestName\Hy@pstringDest\pdfview
5066 \Hy@RestoreLastskip
5067 }

```

```

5068 \let\pdf@endanchor\empty
\Hy@DestName Wrap the call of \pdfdest name in \Hy@DestName. Then it can easier be catched by
5069 \def\Hy@DestName#1#2{%
5070 \pdfdest name{#1}#2\relax
5071 }

```

Now the links; the interesting part here is the set of attributes which define how the link looks. We probably want to add a border and color it, but there are other choices. This directly translates to PDF code, so consult the manual for how to change this. We will add an interface at some point.

```

### 45.3 **hypertex**

The HyperT<sub>E</sub>X specification (this is borrowed from an article by Arthur Smith) says that conformant viewers/translators must recognize the following set of \special commands:

**href:** html :<a href = "href\_string">  
**name:** html :<a name = "name\_string">  
**end:** html :</a>  
**image:** html :<img src = "href\_string">  
**base\_name:** html :<base href = "href\_string">

The *href*, *name* and *end* commands are used to do the basic hypertext operations of establishing links between sections of documents. The *image* command is intended (as with current html viewers) to place an image of arbitrary graphical format on the page in the current location. The *base\_name* command is be used to communicate to the *dvi*

viewer the full (URL) location of the current document so that files specified by relative URL's may be retrieved correctly.

The *href* and *name* commands must be paired with an *end* command later in the TeX file — the TeX commands between the two ends of a pair form an *anchor* in the document. In the case of an *href* command, the *anchor* is to be highlighted in the *dvi* viewer, and when clicked on will cause the scene to shift to the destination specified by *href\_string*. The *anchor* associated with a *name* command represents a possible location to which other hypertext links may refer, either as local references (of the form *href="#name\_string"* with the *name\_string* identical to the one in the *name* command) or as part of a URL (of the form *URL#name\_string*). Here *href\_string* is a valid URL or local identifier, while *name\_string* could be any string at all: the only caveat is that “” characters should be escaped with a backslash (\), and if it looks like a URL name it may cause problems.

```

Because of the interaction with the dvihps processor, we have to subtract a little from the height. This is not clean, or checked. Check with Mark Doyle about what gives here. It may not be needed with the new dvips (Jan 1997).

## 45.4 dviwindo

[This was developed by David Carlisle]. Within a file dviwindo hyperlinking is used, for external URL's a call to \wwwbrowser is made. (You can define this command before or after loading the hyperref package if the default c:/netscape/netscape is not suitable) Dviwindo could in fact handle external links to dvi files on the same machine without calling a web browser, but that would mean parsing the URL to recognise such, and this is currently not done.

This was more or less blindly copied from the hypertex cfg. For dviwindo, L<sup>A</sup>T<sub>E</sub>X must specify the size of the active area for links. For some hooks this information is available but for some, the start and end of the link are specified separately in which case a fixed size area of 1000000sp wide by \baselinestretch is used.

```

The following code (transition effects) is made by Alex Kostin.  
The code below makes sense for VTeX 7.02 or later.  
Please never use `\@ifundefined{VTeXversion}{...}{...}` globally.

```
6194 \ifnum\Hy@VTeXversion<702 %
6195 \else
6196 \def\hyper@pagetransition{%
6197 \ifx\@pdfpagetransition\relax
6198 \else
6199 \ifx\@pdfpagetransition\empty
```

Standard incantation.

1. Does an old entry have to be deleted? 2. If l=yes, how to delete?

```
6200 \else
6201 \hvtex@parse@trans\@pdfpagetransition
6202 \fi
6203 \fi
6204 }
```

I have to write an “honest” parser to convert raw PDF code into VTeX \special .  
(AVK)

Syntax of VTeX \special {! trans <transition\_effect>}:

```
<transition_effect> ::= <transition_style>[,<transition_duration>]

## 45.7 Fix for Adobe bug number 466320

If a destination occurs at the very begin of a page, the destination is moved to the previous page by Adobe Distiller 5. As workaround Adobe suggests:

```
/showpage {
 //showpage
 clippath stroke erasemode
} bind def
```

But unfortunately this fix generates an empty page at the end of the document. Therefore another fix is used by writing some clipped text.

```
6395 <dviwindo>\def\literalps@out#1{\special{ps:#1}}%
6396 <package>\providecommand*\Hy@DistillerDestFix{}
6397 <*pdfmark | dviwindo>
6398 \def\Hy@DistillerDestFix{}%
6399 \begingroup
6400 \let\x\literalps@out
```

The fix has to be passed unchanged through GeX, if VTeX in PostScript mode with GeX is used.

```

## 45.8 Direct pdfmark support (dvipdf and pdfmark)

Drivers that load pdfmark.def have to provide the correct macro definitions of

```
\@pdfproducer for document information
\literalps@out PostScript output
\headerps@out PostScript output that goes in the header area
```

and the correct definitions of the following PostScript procedures:

|         |                                            |
|---------|--------------------------------------------|
| H. S    | start of anchor, link or rect              |
| #1 H. A | end of anchor, argument=baselineskip in pt |
| #1 H. L | end of link, argument=baselineskip in pt   |
| H. R    | end of rect                                |
| H. B    | raw rect code                              |

```

```

We define a single macro, pdfmark, which uses the ‘keyval’ system to define the various allowable keys; these are *exactly* as listed in the pdfmark reference for Acrobat 3.0. The only addition is pdfmark which specifies the type of pdfmark to create (like ANN, LINK etc). The surrounding round and square brackets in the pdfmark commands are supplied, but you have to put in / characters as needed for the values.

```

6686 \newif\ifHy@pdfmarkerror
6687 \def\pdfmark{\@ifnextchar[{\@pdfmark@}{\@pdfmark@[]}}
6688 \def\pdfmark@[#1]#2{%
6689 \Hy@pdfmarkerrorfalse
6690 \edef\@processme{\noexpand\pdf@toks={\the\pdf@defaulttoks}}%

```

```

6691 \@processme
6692 \let\pdf@type\relax
6693 \setkeys{PDF}{#2}%
6694 \ifHy@pdfmarkerror
6695 \else
6696 \ifx\pdf@type\relax

6713 \Hy@endcolorlink
6714 \fi
6715 \fi
6716 \fi
6717 }

```

The complicated bit is working out the right enclosing rectangle of some piece of TeX text, needed by the /Rect key. This solution originates with Toby Thain ([tobyt@netspace.net.au](mailto:tobyt@netspace.net.au)).

For the case breaklinks is enabled, I have added two hooks, the first one for package setouterhbox, it provides a hopefully better method without setting the text twice.

```
\usepackage[hyperref]{setouterhbox}
```

With the second hook, also you can set the text twice, e.g.:

```

\long\def\Hy@setouterhbox#1#2{\long\def\my@temp{#2}}
\def\Hy@breaklinksunhbox#1{\my@temp}
6718 \newsavebox{\pdf@box}
6719 \providecommand{\Hy@setouterhbox}{\sbox}
6720 \providecommand{\Hy@breaklinksunhbox}{\unhbox}
6721 \def\pdf@rect#1{%
6722 <dvipdf> \literalps@out{/ANN \pdf@type\space\the\pdf@toks\space <>}#1%
6723 \leavevmode
6724 \ifHy@breaklinks
6725 \Hy@setouterhbox\pdf@box{#1}%
6726 \else
6727 \sbox\pdf@box{#1}%
6728 \fi
6729 \dimen@ht\pdf@box
6730 \ifdim\dp\pdf@box=\z@
6731 \literalps@out{H.S}%
6732 \else
6733 \lower\dp\pdf@box\hbox{\literalps@out{H.S}}%
6734 \fi

```

If the text has to be horizontal mode stuff then just unbox the saved box like this, which saves executing it twice, which can mess up counters etc (thanks DPC...).

```

6735 \ifHy@breaklinks
6736 \expandafter\Hy@breaklinksunhbox
6737 \else
6738 \expandafter\box
6739 \fi
6740 \pdf@box

```

but if it can have multiple paragraphs you'd need one of these, but in that case the measured box size would be wrong anyway.

```

\i fHy@breakl i nks#1\el se\box\pdf@box\fi
\i fHy@breakl i nks{#1}\el se\box\pdf@box\fi

6741 \ifdim\dimen@=\z@
6742 \literalps@out{H.R}%
6743 \else
6744 \raise\dimen@\hbox{\literalps@out{H.R}}%
6745 \fi
6746 \pdf@addtoksx{H.B}%
6747 }

```

All the supplied material is stored in a token list; since I do not feel sure I quite understand these, things may not work as expected with expansion. We'll have to experiment.

```

Unfortunately, some parts of the pdfmark PostScript code depend on vagaries of the dvi driver. We isolate here all the problems.

## 45.9 Rokicki's dvips

dvips thinks in 10ths of a big point, its coordinate space is resolution dependent, and its *y* axis starts at the top of the page. Other drivers can and will be different!

The work is done in SDict, because we add in some header definitions in a moment.

```
7049 <*dvips>
```

```

```

Unless I am going mad, this *appears* to be the relationship between the default coordinate system (PDF), and dvips;

```

/DvipsToPDF { .01383701 div Resolution div } def
/PDFToDvips { .01383701 mul Resolution mul } def

```

the latter's coordinates are resolution dependent, but what that .01383701 is, who knows? well, almost everyone except me, I expect... And yes, Maarten Gelderman <mgelman@econ.vu.nl> points out that its 1/72.27 (the number of points to an inch, big points to inch is 1/72). This also suggests that the code would be more understandable (and exact) if 0.013 div would be replaced by 72.27 mul, so here we go. If this isn't right, I'll revert it.

```

7062 /DvipsToPDF { 72.27 mul Resolution div } def
7063 /PDFToDvips { 72.27 div Resolution mul } def

```

The rectangle around the links starts off *exactly* the size of the box; we will to make it slightly bigger, 1 point on all sides.

```

7064 /HyperBorder { 1 PDFToDvips } def

```

The calculation of upper left *y* is done without raising the point in TeX, by simply adding on the current \basel i neski p to the current *y*. This is usually too much, so we remove a notional 2 points.

We have to see what the current baselineskip is, and convert it to the dvips coordinate system.

Argument: baselineskip in pt. The *x* and *y* coordinates of the current point, minus the baselineskip

## 45.10 VTeX's vtexpdfmark driver

This part is derived from the dvips (many names reflect this).

The origin seems to be the same as TeX's origin, 1 in from the left and 1 in downwards from the top. The direction of the *y* axis is downwards, the opposite of the dvips case. Units seems to be pt or bp.

```

## 45.11 Textures

At the suggestion of Jacques Distler ([distler@golem.ph.utexas.edu](mailto:distler@golem.ph.utexas.edu)), try to derive a suitable driver for Textures. This was initially a copy of dvips, with some guesses about Textures behaviour. Ross Moore ([ross@maths.mq.edu.au](mailto:ross@maths.mq.edu.au)) has added modifications for better compatibility, and to support use of pdfmark.

Start by defining a macro that expands to the end-of-line character. This will be used to format the appearance of PostScript code, to enhance readability, and avoid excessively long lines which might otherwise become broken to bad places.

\Hy@ps@CR The macro \Hy@ps@CR contains the end-of-line character.

```

7183 {*textures}
7184 \begingroup
7185 \obeylines %
7186 \gdef\Hy@ps@CR{\noexpand
7187 }
7188 \endgroup %

```

Textures has two types of \special command for inserting PostScript code directly into the dvi output. The ‘postscript’ way preserves TeX’s idea of where on the page the \special occurred, but it wraps the contents with a save–restore pair, and adjusts the user-space coordinate system for local drawing commands. The ‘rawpostscript’ way simply inserts code, without regard for the location on the page.

Thus, to put arbitrary PostScript coding at a fixed location requires using *both* \special constructions. It works by pushing the device-space coordinates onto the operand stack, where they can be used to transform back to the correct user-space coordinates for the whole page, within a ‘rawpostscript’ \special.

```

7189 \def\literalps@out#1{%
7190 \special{postscript 0 0 transform}%
7191 \special{rawpostscript itransform moveto\Hy@ps@CR #1}%
7192 }
7193 %

```

The ‘prepostscript’ is a 3rd kind of \special, used for inserting definitions into the dictionaries, before page-building begins. These are to be available for use on all pages.

```

7194 \def\headerps@out#1{%
7195 \special{%
7196 prepostscript TeXdict begin\Hy@ps@CR
7197 #1\Hy@ps@CR
7198 end%
7199 }
7200 }
7201 %

```

To correctly support the pdfmark method, for embedding PDF definitions with .ps files in a non-intrusive way, an appropriate definition needs to be made *before* the file pdfmark.def is read. Other parameters are best set afterwards.

```

## 47 Bookmarks in the PDF file

This was originally developed by Yannis Haralambous (it was the separate `repere.sty`); it needed the `repere` or `makebook.pl` post-processor to work properly. Now redundant, as it is done entirely in L<sup>A</sup>T<sub>E</sub>X macros.

To write out the current section title, and its rationalized number, we have to intercept the `\@sect` command, which is rather dangerous. But how else to see the information we need? We do the *same* for `\@ssect`, giving anchors to unnumbered sections. This allows things like bibliographies to get bookmarks when used with a manual `\addcontentsline`

```
8806 \def\phantomsection{%
8807 \Hy@GlobalStepCount\Hy@linkcounter
8808 \xdef\@currentHref{section*\.\the\Hy@linkcounter}%
8809 \Hy@raisedlink{\hyper@anchorstart{\@currentHref}\hyper@anchorend}%
8810 }
8811 /package}
```

### 47.1 Bookmarks

```
8812 {*outlines}
```

This section was written by Heiko Oberdiek; the code replaces an earlier version by David Carlisle.

The first part of bookmark code is in section 6. Further documentation is available as paper and slides of the talk, that Heiko Oberdiek has given at the EuroTeX'99 meeting in Heidelberg. See `paper.pdf` and `slides.pdf` in the `doc` directory of `hyperref`.

Tobias Oetiker rightly points out that we need a way to force a bookmark entry. So we introduce \pdfbookmark, with two parameters, the title, and a symbolic name. By default this is at level 1, but we can reset that with the optional first argument.

```
8893 \renewcommand{\pdfbookmark}[3][0]{%

```

The macros for calculating structure of outlines are derived from those by Petr Olsak used in the `texinfopdf` macros.

The VTEX section was written originally by VTEX, but then amended by Denis Girou (denis.girou@idris.fr), then by Taco Hoekwater (taco.hoekwater@wkap.nl). The problem is that VTEX, with its close integration of the PDF backend, does look at the contents of bookmarks, escaping \ and the like.

```

8899 <*vtex>
8900 \newcount\@serial@counter\@serial@counter=1\relax

```

`\hv@pdf@char` Plain octal codes doesn't work with versions below 6.50. So for early versions hex numbers have to be used. It would be possible to program this instead of the large `\ifcase`, but I'm too lazy to sort that out now.

## 48 Compatibility with koma-script classes

```
9152 <*outlines | hypertex>
```

Hard-wire in an unpleasant over-ride of komascript ‘scrbook’ class for Tobi as. I senberg@gmx. de. With version 6.71b the hack is also applied to ‘scrreprt’ class and is removed for komascript versions since 2001/01/01, because Markus Kohm supports hyperref in komascript.

```

No glyph \177 in PDFDocEncoding.

### 49.2.2 Latin-1 Supplement

```
9467 \DeclareTextCommand{\textminus}{\PU}{-} % minus, \80\212
9468 \DeclareTextCommand{\textfi}{\PU}{fi} % fi ?? \80\223
9469 \DeclareTextCommand{\textfl}{\PU}{fl} % fl ?? \80\224
```

There are two positions for the glyphs from \80\225 until \80\236. See the test files testbmoe., testbml, testbmse, testbmzc, and testbmyi for details. Problematic are all positions, but especially \OE, \oe, and \i.

```
9470 \% \DeclareTextCommand{\OE}{\PU}{OE} % OE
9471 \% \DeclareTextCommand{\oe}{\PU}{oe} % oe
```

The euro \240 is inserted in version 1.3 of the pdf specification.
